IRIDEÆ, or IRIDACEÆ, a natural order of endogenous plants, mostly herbaceous, although a few are somewhat shrubby. They have very generally either root-stocks or corms. The leaves are generally sword-shaped, in two rows, and equidistant (so placed that one seems to ride on the back of another). The perianth is 6-partite, coloured, often very beautiful, in some regular, in others irregular. The stamens are three, with anthers turned outwards. The ovary is inferior; there is one style, with three stigmas, which are often petal-like, and add much to the beauty of the flower. The fruit is a 3-celled, 3-valved capsule. Almost 600 species are known, of which the greater number are natives of warm countries. They are particularly abundant in South Africa. A few are British. Iris, Gladiolus, and Crocus are familiar examples of the order. Saffron is the principal economical product. Accridity is a prevailing characteristic, and some species are medicinal; but the corms and root-stocks of some are edible.

IRIDIUM (sym. Ir, gr. 15933) is one of the so-called noble metals. It is occasionally found native and nearly pure in considerable masses among the Uralis ores of platinum, but is usually combined with osmium as an alloy in flat scales. It is a very hard, white, brittle metal, which may be melted by the oxyhydrogen blowpipe, or by the heat of a voltaic current. In its isolated form, it is unacted upon by any acid, or by aqua regia, but as an alloy it dissolves in the latter fluid.

It forms three oxides, IrO, IrO2, and IrO3, which pass readily into one another, and the oxygen combines with the various tints which solutions of the salts of this metal assume. It was in consequence of these varying tints that the name of iridium, from Iris, the rainbow, was given to this metal. Three sulphides and chlorides, corresponding to the oxides, have been obtained. This metal was discovered at the same time as osmium, in 1803, by Smithson Tennant.

IRIS, in Classic Mythology, the daughter of Thaumas and Eupheme. She is described (in Homer) as a virgin goddess; but later writers state that she was married to Zephyrus, by whom she became the mother of Eros. She was employed, like Mercury, as the messenger of the gods, and to conduct female souls into the underworld, as he conducted the spirits of the dead. She is frequently represented on vases and in bas-reliefs as a youthful winged virgin, with a herald's staff and a pitcher in her hands. There can be no doubt that this myth originated in the physical phenomena of the rainbow, which was personified at first as the messenger of peace in nature.

The broad coloured ring in the eye is called the Iris. See Eye. Iris is also the name of one of the Planetoids (q.v.), discovered in 1847.

IRIS, or FLOWER-DE-LUCE, a genus of plants of the natural order Iridaceæ, having the three outer segments of the perianth reflexed, the three inner arched inwards, and three petal-like stigmas covering the stamens. The species are numerous, chiefly natives of temperate climates. The Yellow I. or CORN FLAG (I. pseudacorus), is a well-known native of moist grounds in all parts of Britain, often spreading over a considerable extent of land, and conspicuous even at a distance by its tall leaves and large yellow flowers. The Stinking I. (I. foetidissima) is very abundant in some of the southern parts of England, but does not extend far north. It has vivid purple flowers. The leaves have a very disagreeable smell. The south of Europe produces a greater number of species, as also does North America. The flowers of most of the species are beautiful. Some of them have received much attention from florists, particularly I. zephyrimum, some times called Spanish I.; I. zephroides, or English I., and I. Germanica, or Common I., all corn-rooted species, and all European. Many fine varieties have been produced. The Persian I. (I. Persica), the Snake's-head I. (I. tuberosa), and the Chalcevonian I. (I. Soustana) are also much esteemed. The Persian I. is delightfully fragrant. The roots of all these species are annually exported in considerable quantities from Holland. Many other species are of frequent occurrence in flower-gardens.—The fresh root-stocks of I. pseudacorus are very acid, as are those of many other species. Those of I. Florentina, I. pallida, and I. Germanica are Orris Root (q.v.). Those of I. dichotoma are eaten in Siberia; those of I. edulis at the Cape of Good Hope.

IRISH (GAEIC) LANGUAGE AND LITERATURE. The Irish (Gaelic) is one of the still living Celtic languages (see CELTIC NATIONS). The alphabet consists of the following eighteen letters—

a, b, c, d, e, f, g, h, i, l, m, n, o, p, r, s, t, u, v,

corresponding to the sounds in the names of the Roman characters of the 5th c. after Christ. In Irish, there is no indefinite article; nouns are masculine or feminine, and anciently a neuter gender existed. The nominative and accusative are the same in form, as are also the dative and ablative; the nominative and vocative feminine, and the genitive and vocative masculine, always have similar terminations. Nouns substantive have five, and nouns adjective four declensions. Verbs are active, passive, regular, irregular, imperfertive, and perfect; their moods are indicative, conjunctival, past indicative, imperative, infinitive, and conditional; regular active verbs have no subjunctive; the tenses are the present, conjunctival present, perfect, past infinitive, past and future; in the tenses of the passive voice there is no distinction of number or person. Prepositions are rarely compounded with verbs or adjectives, instead of which the Irish use prepositions or adverbs placed after the verbs. Adverbial phrases composed of two or more parts of speech are very numerous both in ancient and in modern Irish. The simple conjunctions are few, but there are many conjunctival phrases. Interjections are numerous, and vary throughout the provinces. The
IRISH MOSS—IRISH SEA.

regular v. estimation the Irish consists of four distinct modes, styled Oghluas, Droichneacht, Brailingeacht, and Dan Dirvach; of the last, there are five species, each distinguished by peculiar features. There are also classes of popular poetry possessing distinct linear and syllabic components. The Naomh (sacred) and the Irish Grammar, by J. O'Donovan (1845); the Grammatica Colica of J. C. Zeuss (1856); and Irish Glosses (1860), published by the Irish Archseolological Society.

The oldest existing specimens of the Irish language are to be found in sepulchral inscriptions in Ireland, and in the glosses or interpretations affixed to Latin words in documents transcribed by Irish ecclesiastics of the 8th and succeeding centuries, now preserved in some continental libraries. The principal ancient vernacular manuscripts in Ireland are Leabhar na-h-Udhré, and the Book of Leinster (12th c.); the Books of Ballymote, Lecan, and Dun Dougher, or Leabhar Breac (14th c.) all compiled from older writings on historical and miscellaneous subjects. The most ancient manuscripts in Ireland containing original matter in the Irish language are the Book of Armagh (9th c.); the Book of Hvma, of the period (11th c.), both ecclesiastical in their contents. The writings extant in the Gaelic language of Ireland consist of ecclesiastical documents, laws, bardic or semi-historic tales, historic tractates, genealogies, historic poems, treatises on medicine, translations from foreign authors, proverbs, compilations of the 17th c., popular poetry, political and satirical poems, and songs, composed by native Gaelic writers in Ireland within the 17th century. Of the ecclesiastical documents, the next in importance, after the Book of Armagh and the Book of Hvma, are the metrical Fentoscopies of Enagus Célla De (9th c.), the Martyrology of Tallaght (10th c.), and the Speculum of St. Nigean (12th c.). In this department there are also extant many lives of saints, monastic rules, devotional and religious poems. A large body of old Irish jurisprudence, known as the Bréhon Laws, is preserved in manuscripts of the 14th and 15th centuries. Of the Irish bardic or semi-historic tales, numbers are extant ranging in date from the 12th to the 18th century. The principal Irish historic tractates are those on theatres, Gernad, the wars of the Dunes with the Irish, and the wars of Thomond. Copious genealogies of the principal native families exist in various manuscripts, and from such sources MacFirbis, a learned Irish antiquary of the 17th c., made an elaborate compilation known as Leabhar Greenlock, or the 'Genealogical Book,' now considered a high authority. The chief composers of poems on the history of Ireland were Eochadh O'Fluain (10th c.), Gilla Casmhín, and Fionn of Monsterbone (11th c.). The most important ancient Irish annals are those of Tighearnach, of Ulster, of Inisfallen, and of Connacht.

The Irish manuscripts on medicine contain original treatises by native physicians of the 14th and 15th centuries, with commentaries on the then known medical authors of Europe and the East. The Irish translations from foreign languages are chiefly versions of medieval Latin and continental books on ecclesiastic, contum, and religious literature. Of original adages and proverbial sentences, great numbers exist, of various ages. The privileges enjoyed by the Irish poets under the clau system enabled them to devote themselves to the production of elaborate metrical compositions, many of which possessed high excellence, and elicited the praises of the poet Spenser. During the wars against the English, the bards were energetic in stimulating the cause to whom they were attached.

The merit of the elegiac poesy on the death of the Earl of Tyrone and Tyrconnell by their bard Mac an Bhaird, who accompanied them in exile (1608 A.D.), attracted the attention of the critical Lord Jeffrey, who became acquainted with a number of Irish in the English version in the metre of the original. Among the native writers in Ireland after the establishment of the English dominion, in the reign of James I., was Dr. Geoffrey Keating, compiler of the History of Ireland, an ecclesiastical, national, and literary work, of importance. Of the present century, the most important of which was that styled the Annales of the Four Masters, was a work issued from the earliest period to 1616 A.D., edited in seven large volumes (Dublin, 1848), with an English version and copious notes, by the late Dr John O'Donovan, the ablest of Irish scholars. The Gaelic continued to be the language of the native rural population of Ireland during the 17th and 18th centuries, and many religious and romantic pieces were composed in it for popular use. Differing from the English settlers in religious and political sentiments and manners, the Irish have, at somewhat later periods, been caricaturing and ridiculing in the Gaelic language, in which they composed numerous songs in favour of the Stuarts, and denunciatory of the Hanoverians, and the English. A number of old Irish bards, who attained high distinction in military service on the continent, retained with pride the Gaelic tongue; it was also commonly spoken by the soldiers in the Irish Brigades in France, and in the American army during the last century. Various attempts were made since the middle of the last c. to print Gaelic documents, but the critical knowledge of the language in its archaic forms having fallen into abeyance, such publications have been entirely unsuccessful, until the object was taken up about 1820 by government, during the progress of the Ordnance Survey of Ireland. From this may be said to date the true Irish school of accurate historic and linguistic learning, which has since produced many ableable volumes under the superintendence of the Antiquarian section of the Royal Irish Academy and the Irish Archæological and Celtic Society. On the works issued by these bodies, which for many years have included nearly all the most erudite scholars of Ireland, philological and historic students must now depend, as other publications on these subjects are, with few exceptions, illusory and misleading.

The Irish, in its modern forms, is still spoken commonly by the rural classes and native landowners in Connaught, Munster, the remote parts of Ulster, the south of Leinster, as well as in the islands off the western coast of Ireland. The provincial dialects vary considerably in words, pronunciation, and idioms. The Irish emigrants have carried their language across the Atlantic, and song and poems in the Irish language and character occasionally appear in American newspapers. Professorships of the Irish language exist in Trinity College, Dublin; in the Queen's Colleges at Belfast, Cork, and Galway; and in the Roman Catholic College at Maynooth. The chief collections of Irish manuscripts in the native Irish scripts are found in the Irish Academy, Trinity College, Dublin; numbers are also preserved in the British Museum, in the Bodleian, and in some private libraries.

IRISH MOSS. See CARRAGHEN.

IRISH SEA, a continuation northward of St George's Channel (q.v.), separates the north of Ireland from the central districts of the United
IRITIS—IRON.

Kingdom. Between the coasts of Louth and Lancaster, the I. S. has a width of 120 miles; its greatest length between St George's Channel on the south and the North Channel on the north is about 120 miles.

IRITIS is the term applied to inflammation of the iris. See EYE. The cavity across which the iris is stretched, and the iris itself, which projects into that cavity, and divides it into an anterior and a posterior chamber, are lined or invested by a membranous lining, which resembles the membranes of the body, such as the pleura, peritoneum, &c., and consequently the inflammation of this membrane is of the adhesive kind. See INFLAMMATION. While it is added that the effusion of lymph may limit or entirely stop the movements of the iris, and may alter the form, or even close up the aperture of the pupil, the serious nature of the disease will be at once perceived.

The objective symptoms of iris (those which can be observed by the physician) are: 1. Redness of the eye, arising from vascularity of the sclerotic; 2. Change in the colour of the iris. When lymph is effused in the texture of the iris, a gray or blue eye is produced; a yellowish or greenish, while in a dark eye a reddish tint is produced. The brilliancy of the colour of the iris also disappears. When the inflammation is very violent, or has been unchecked by remedies, suppuration may take place, and sometimes insufficiency of the pupil, produced by the adhesion of the back of the iris to the crystalline lens. The subjective symptoms (those of which the patient alone is conscious) are intolerance of light, dimness of vision, and pain in and around the eye.

The causes of iritis are various. The disease may arise from actual injury in surgical operations performed on the eye: from over-exertion, and too prolonged continuous use of the eye (thus, it is common among needlewomen, engravers, and watchmakers); or from some constitutional taint, especially atrophies, gout, rheumatism, and scrofula.

The treatment of iritis varies to some extent according to the cause which induces it, but the great remedies are three. 1. Blood-letting, for the purpose of moderating the febrile disturbance, and of facilitating the operation of the second remedy, which is, 2. Mercurius, which used to be given in large doses (such as two, three, or four grains, with a little opium, every four or six hours), but which is preferably given in small doses, such as two or three grains of hydrarg. c. creta, with a little hyoscyamus, two or three times in the twenty-four hours. This dose should be lessened as soon as the mouth begins to be tender, and by that time the lymph will be found to break up, and leave the pupil clear. 3. Belladonna. The pupil should be kept well dilated by the application of the extract of belladonna to the skin round the eye, or, far better, by the instillation into the eye of a weak solution of sulphate of atropine, with the view of preventing adhesion of the iris, or of breaking or, at all events, of stretching and elongating any adhesion bands that may be formed; and thus of preventing any impairment of the movements of the iris, and any irregularity of the pupil, after the inflammation shall have abated.

IRKUTSK, capital of the Russian government of that name, is the residence of the governor-general of Eastern Siberia, and the seat of a bishop. It is situated on the right bank of the Angara, near its confluence with the river Irkut, in lat. 52°17' N., and long. 104°26' E., and is 3842 miles distant from St Petersburg. The town is about 1200 feet above the level of the sea, and enjoys a very healthy climate, though in winter the cold is so severe as to freeze mercury. The streets are straight and wide, but ill-paved, and the houses, mostly built of red bricks, are the palace of the governor-general, the schools for boys and girls, and the hall of the American Company. Besides these, the town contains a public library, a museum of natural history, and some other public institutions. The population in 1858 was 18,908, consisting mostly of Russians and Burials. I. was founded in 1661 by a Cossack chief named Ivan Pochapof, and, owing to its position on the great thoroughfare between Eastern and Western Siberia, between China and Russia, it soon became the commercial centre of Siberia, especially for the tea-trade. The current of the Angara is so rapid that the strongest frosts cover it but seldom with ice. Nevertheless, it is navigable, and constitutes the mainway for the goods bound for Kiachta by means of Lake Baikal, as well as for those coming from Eastern Siberia, Russian America, and China to Irkutsk. The former are chiefly furs and metals; the latter, tea, meat, and fish from Lake Baikal. The communications between I. and Jakutsk, and the other northern towns of Siberia, are carried on by the river Lena. The manufactures of I. are purely local, and supply the half-nomad Burias and Tunguses, inhabiting the adjacent country.

IRKUTSK, a government of Eastern Siberia, bounded by the government of Jenisseisk, the province of Jakutsk and the Chinese Empire, occupies an area of 267,355 square miles. The soil is partly arable, partly hilly and marshy, the climate in general severe. The Baikal and Nerninsk Mountains, with their numerous glaciers, give the country a high alpine character; besides these, the Sahim range extends along the southern borders, and the Jambolovoy or Apple range along the eastern. The principal rivers are the Lena, Shilika, Agdin; the largest lake is the Baikal (q. v.). The productions of the country are rye, wheat, barley, oats, ryebar, hops; reindeer, sables, ermines, foxes, seals; fish—sturgeon, cod, silure; minerals—gold, silver, lead, jasper, amethysts, topazes, emeralds, yellow amber, rock-salt, and coal. The population of the government exceeds 25,000, and consists in great part of Russians. The inhabitants are for the most part employed in agriculture, and to some extent in fishing and hunting. As a local industry, the manufacturing of an excellent oil out of stone-pine nuts deserves notice. The foreign commerce is very small, the trade with China, carried on through Troitzko-Savsk and Kiachta (q. v.), and has risen to great importance in recent times.

The government of I. is divided into two districts—Irkutsk and Kirensk—and the township of Kiachta. The capital is Irkutsk; the other towns are Telma, with a cloth-factory, Troitzko-Savsk, Kiachta, Kirensk on the Lena, Nijneudinsk, and Verkholenisk.

IRON (sym. Fe [Lat. ferrum], eq. 28, sp. gr. 7.844) occurs more abundantly than any other metal. In its native form it is chiefly found in meteoric stones (see ABROLITES), and in certain ores of platinum, and is consequently of comparatively rare occurrence, but the so-called iron ores—that is, the oxides of iron, &c.—are very widely distributed. The most important of these ores are mentioned below.

Pure iron may be obtained by the ordinary method described below, and also by reducing the oxide of iron by carbon. East when it is obtained in the form of a fine black powder,
or by heating the protochloride in a glass tube through ferric acid current of dry hydrogen is passed. In this case, pure iron is deposited as a listening mirror on the glass.

This important metal will be most conveniently considered under the three heads of

Chemical Properties of Iron.—Chemically pure iron is of so little general interest that we shall confine our remarks to the properties of this metal to those which are exhibited by bar or wrought iron. Its colour is grey or bluish-white; it is hard and lustrous. This is its characteristic in the form of crystals. When broken across, it exhibits a rugged fracture. It requires a very intense heat for its fusion, but before melting passes into a soft pasty condition, in which state two pieces of iron may, by being hammered together, be united or welded so completely as to form, to all intents and purposes, a single portion. At a red heat, it may be readily forged into any shape; but at ordinary temperatures it is very hard, and may be easily scratched with gold and silver. In ductility, it stands very high, being barely exceeded by gold, silver, and platinum; and in tenacity, it is only exceeded by cobalt and nickel. Its susceptibility to magnetism is one of its most striking characteristics.

At high a temperature, it burns readily, as may be seen at the forge, or (more strikingly) when a glowing wire is introduced into a jar of oxygen. In dry air and at ordinary temperatures, the lustrous surface of the metal remains unchanged; but in a moist atmosphere the surface rapidly becomes oxidised and covered with rust, which consists mainly of the hydrated oxide of iron. At a red heat, iron decomposes water, and liberates hydrogen, the oxygen combining with the iron to form the black or magnetic oxide (FeO), which occurs in minute crystals. This is one of the ordinary methods of obtaining hydrogen.

The affinities of iron for most of the non-metallic elements are very powerful. The chief of the iron compounds are—

a. Oxides of Iron.—Iron forms four definite compounds with oxygen—viz. (1), the protoxide (FeO), which is the base of the green or ferrus salts of iron; (2), the sesquioxide or peroxide (Fe₂O₃), which is the base of the red or ferric salts; (3), the black or magnetic oxide (Fe₃O₄), which is regarded by some chemists as a compound of the two preceding oxides; and (4), the sesquioxide or ferric oxide (Fe₂O₃). The protoxide cannot be obtained in an isolated form, but it forms the base of various ferrous salts, and combines with water to form a hydrate (FeOH), which, on the addition of an alkali, falls in white flakes.

The most important predecessors of iron, or ferrous salts, are the carbonate, the sulphate, the phosphates, and the silicate.

Carbonate of iron (Fe₂CO₃) exists naturally in various minerals, and may be obtained artificially by precipitating a soluble protoxide of iron with carbonate of potash or soda, when the carbonate falls in white flakes. On exposure to the air, it absorbs oxygen, and gives off carbonic acid, and is thus converted into the hydrate of protoxide. Sulphate of iron (Fe₂SO₄·7H₂O) is obtained by the solution of iron, or its sulphide, in dilute sulphuric acid; in the former case, there is an evolution of hydrogen, and in the latter, of sulphurated hydrogen. The reactions in the two cases are expressed by the equations

\[
\text{FeO} + \text{H}_2\text{O} = \text{Fe} + \frac{1}{2}\text{O}_2
\]

On evaporation of the solution, the salt is obtained in clean bluish-green rhomboidal crystals, containing seven atoms of water. This salt is commercially known as copperas or green vitriol, and its various applications in technology are noticed in the article ARTICLES ON CHEMISTRY. In medicine, it is used in the form of a saltpetre or vitriol, and is exceedingly powerful.

Phosphate of iron is obtained by precipitating a solution of a protoxide of iron with phosphate of soda, when a white precipitate of phosphate of iron is thrown down.

All salts of iron, especially the carbonate and sulphate, are extensively used in medicine.

Silicate and phosphate of iron occur naturally in several minerals.

The peroxide of iron, termed also sesquioxide, red oxide, or ferric oxide, is obtained in an anhydrous form by igniting the protoxide, and is known in the arts under the names Collochar, Crouse of Mars, or Rouge, according to the degree of levigation to which it has been submitted. It is employed for polishing glass, jewellery, &c, and is also used as a pigment. It occurs both in the anhydrous and in the hydrated form in various minerals.

The hydrated peroxide (2Fe₂O₃·3H₂O) is obtained by precipitating a solution of a persal of iron or of a ferric salt, with an excess of potash, ammonia, or alkaline carbonate. It falls as a yellowish-brown flocculent precipitate, which when dried forms a dense brown mass. This hydrated peroxide in modero is the chief source of iron glass. The peroxide of iron suspended in water, is regarded as an antidote in arsenical poisoning. Rust, as has been already mentioned, is a hydrated peroxide, combined with a little ammonia.

The most important of the persalts of iron, or ferric salts, are the neutral and the basic sulphate, whose formulae are Fe₂O₃·3SO₃, Fe₂O₃·3SO₃·5FeO, respectively, the nitrate (Fe₂O₃·3NO₃), the phosphat, and the silicate. Of these, the neutral sulphate, the phosphat, and the silicate occur in various parts of the world. The nitrate, which is obtained by the solution of iron in nitric acid, is a useful medicinal agent.

The block or magnetic oxide and ferric acid, which has not been obtained in a free state, and is only known as a constituent of certain salts, must be passed over without comment.

b. Haloid salts of iron—the chlorides, bromides, and iodides—next require notice. There are two chlorides—viz., a protochloride (FeCl) and a perchloride or semichloride (FeCl₂). The latter may be obtained by dissolving peroxide of iron in hydrochloric acid. The tincture of the sesqui-chloride of iron is perhaps more generally employed than any other preparation for this metal.

The protochloride is an extremely valuable therapeutic agent.

c. There are probably several sulphides or sulphurates of iron. The ordinary sulphide is a proto.

Phosphate of iron (Fe₈S₇) it occurs in small quantity in meteoric iron. It may be obtained artificially by the direct union of the two elements at a high temperature, or by the precipitation of a protoxide of iron by sulphide of ammonium. It exists in glistening masses, varying in colour from a grayish yellow to a reddish brown. It is insoluble in water, but in moist air becomes rapidly oxidised into protosulphate of iron. With acids, it develops sulphurated hydrogen.

The bisulphide of iron (Fe₈S₉) is the iron part of those mineralogists, and the mundic of commerce. Under the latter name, it is used extensively in the preparation of oil of vitriol. There are also other sulphides of less importance.

The carbonate and the peroxide, or the ferrus and the ferric salts, give totally different reactions with the ordinary tests. The solutions of the former have a greenish color and a peculiar metallic taste, while those of the latter are generally of a brownish-yellow colour, and are very acid. Sulphurated hydrogen gives no precipitate with an acid solution of a ferrous salt, while it gives a milky precipitate.
of sulphur with a solution of a ferric salt. Potash, soda, and ammonia throw down a white hydrated oxide from the former, and a brown hydrated peroxide from the latter. Ferrocyanide of potas-
sium gives the ferric salt, a white precipitate, which soon becomes blue, while with ferric salts it at once produces a blue precipitate, even in a very dilute solution. Tincture of gall (tannic acid) produces no immediate change of colour with the ferric salts, but, when heated in a reducing fluid (ink) with the ferric salts. Sulphocyanide of potassium produces no change with the ferrous, but gives a deep blood-red tint with the ferric salts. Siccinate and bennenate of ammonia produce no precipitate or change of colour. The three processes taken together, if the solution is not too acid, they throw down pale reddish-brown precipitates.

2. Manufacture of Iron.—The increasing use of iron is a prominent characteristic of the present age. Every day sees some new application of it in the arts of life. Although the most useful of the metals, it was not the first known. The difficulty of reducing it from its ores would naturally make it a comparatively late discovery. See also Bronze, and Bronze Period. The reduction of the ore known as the black oxide of iron, however, has been carried on in India from the earliest times.

In Europe, the richest specular and other ores of Spain and Elba were much used during the Roman period; in Greece, also, iron was known, though, as among the Romans, its use was subsequent to that of bronze. We are informed, too, by the Roman his-
torians that this metal was employed by the ancient Britons for the manufacture of spears and lances. The Romans, during their occupation of Britain, manufactured iron to a considerable extent, as is evidenced by the cinder-heaps in the Forest of Dean and other places. The three processes taken together, if used together, produce much iron in this country from those ores in the following way:

—

There is a sparry carbonate of iron, termed spathose iron and which is of considerable importance in the manufacture of steel, and which is extensively used in France, Belgium, Prussia, and Austria.

Bog iron ore is a mixture of brown hematite and phosphatite of iron, occurring in marshy districts of recent formation. This ore is also extensively smelted in France.

There is a sparry carbonate of iron, termed spathose iron and which is of considerable importance in the manufacture of steel, and which is extensively used in France, Belgium, Prussia, and Austria.

Bog iron ore is a mixture of brown hematite and phosphatite of iron, occurring in marshy districts of recent formation. This ore is also extensively smelted in France.
the cabinet of the mineralogist. But there remains to be noticed a dull, blackish or clay-coloured mineral, possessing no beauty or symmetry, which Great Britain possesses as one of her greatest mineral treasures: this is the ironstone of the coal-measures, which is variously named clay iron ore, clay carbonate of iron, and blackband. It is essentially a mixture of carbonate of iron with clay, common belonging to water, and in the case of blackband, coaly or bituminous matter. It is estimated that the coal-measures of Great Britain produce about nine-tenths of our iron; and it is a fortunate thing that, along with the ore, are found both the fuel and the limestone that are indispensable for its reduction.

About ten years ago, the three great iron districts of Britain were South Staffordshire, South Wales, and Central Scotland, each producing nearly equal quantities, and together yielding about four-fifths of the total produce of the country. Now, however, the South Staffordshire field is being rapidly exhausted, its produce having diminished about a half, whereas that of the South Wales and Scottish districts have increased, and they are now yielding nearly a million tons each. North Staffordshire, Shropshire, Derbyshire, and the West Riding of Yorkshire are the principal remaining districts yielding ore of this class, but their total produce is not more than that of South Staffordshire, although the iron of the West Riding is the best in Britain as regards quality.

There is yet another great iron district, yielding an ore more recent formation than the carboniferous beds—namely, the lias. This deposit, which fifteen years ago was unknown, is already producing iron to the enormous amount of 400,000 tons per annum. It is the ironstone of the Oldham Hills, in the north-east of Yorkshire, which, from its resemblance to common sandstone, passed unnoticed till 1847. About that time, isolated blocks of it, found on the sea-coast, were discovered to contain about 50 per cent of iron. On further examination of the district, these were proved to be detached pieces of a massive bed, no less than 15 feet thick, which could be traced for many miles along the sides of the hills. Some idea of the value of this vast deposit of iron ore will be found in the fact, that the ironstone seams of the coal-measures seldom exceed 20, and are worked as low as 8 inches in thickness. Another mass of ironstone of great thickness, also belonging to the lias, is to be found in the north-west of North Lincolnshire. In the colite, too, beds of brown iron ore have been discovered in several counties, but chiefly in Northamptonshire, where it has been worked with so much spirit, that from 150,000 to 200,000 tons of ore per annum are now raised.

To those remarkable discoveries may be added that by Mr Rogers of Abercarn, who, after examining the position of the pisolithic ore at the base of the carboniferous limestone in Belgium, searched the corresponding strata in South Wales, and curiously enough was rewarded with the discovery of a precisely similar bed at Cwm Noddi. The same gentleman, struck by the appearance of the sparry carbonates of iron in the Austrian and Prussian departments of the Exhibition of 1851, soon afterwards noticed veins of a like ore in the Devonian rocks of Somersetshire. In fact, the sources which have been discovered within the last fifteen years are already yielding a larger supply of iron than the total produce of any other European country except France.

Before proceeding to describe the manufacture of iron, we give two analyses of British ores: the first is by Mr. J. Spiller, taken from a series published in 1847.

It will be noticed that in the case of these ores the impurities are rather numerous. Nevertheless, the modes of preparing and smelting them are somewhat rude and simple, as the low price of iron will not permit of its ores being treated with the same care as the ores of lead, copper, tin, and some other metals.

Iron ore is still reduced in the south of Europe by the old and imperfect process of the Catalian forge, not unlike a common smith's forge. In Great Britain, however, as well as in all other countries where iron is largely smelted, the blast-furnace is now universally employed, by means of which the metal is obtained in the state of crude or cast iron. For this purpose the furnaces are generally open, and the metal smelted in a very crude state, but the fuel used in these furnaces is the coke, which is found in abundance throughout Great Britain. There are, however, a considerable number of closed furnaces, or charcoal-furnaces, in use in the coal-lands of Wales and Scotland, as well as in other parts of the country. In these, charcoal is used as the fuel, and the metal produced is called charcoal-iron.

As a preliminary process to the actual smelting in the blast-furnace, clay and blackband ironstones are generally roasted. This is accomplished by breaking the ore into small pieces, spreading it in open heaps on the ground, and mingling it with clay or charcoal. The preheated ore is then placed in the blast-furnace, and the impurities separated and removed, and the metal cast into ingots or bars. In this process, the iron is united with carbon from the charcoal or clay, and is converted into the state in which it was at first obtained from the mine. The process of converting iron ore into a metallic state is called smelting, and is performed in three stages: the first is called calcination, the second reduction, and the third desulphuration.

The iron obtained in this way is called crude or cast iron, and is generally employed in the manufacture of cast-iron pipes, stoves, boilers, &c.

The process of converting cast iron into wrought iron is called ironing. The crude iron is generally wrought into slabs, or bars, and subsequently wrought into the required shape by hammering, rolling, &c.

The iron obtained in this way is called wrought iron, and is generally employed in the manufacture of iron rails, bars, plates, &c.

The iron obtained in this way is called wrought iron, and is generally employed in the manufacture of iron rails, bars, plates, &c.
chiefly of carbonic acid and water. When roasted, the ore contains about 10 per cent, more of iron than it does in its raw state; and, moreover, it is reduced to the state of black oxide of iron and clay. It is now ready to be smelted.

The blast-furnace is generally built in the form of a truncated cone, with a massive square base. Internally, it is either barrel-shaped or in the form of a double cone, like two flower-pots placed mouth to mouth. The inside requires to be built of the most refractory firebrick. The external portion is either of common brick or stone, secured with iron binders; without this, the greatest heat would soon displace the most substantial brickwork. A good-sized blast-furnace measures about 30 feet across the base, and is 50 or 60 feet in height. Three sides of the base have arched recesses for the pipes conveying the blast, and on the fourth there is a similar recess, in which are the openings for running off the metal and slag.

Fig. 1 is a sectional view of a hot blast-furnace with the blowing engine and other appliances, which is taken, with some modification, from Mr Fairbairn’s work on Iron. It may be well to state here that one engine usually supplies the blast to several furnaces. A is the body of furnace; B, the hearth, above which are placed the tuyeres; C; D is the tunnel-head, around which there is a gangway, for the workmen to have access to the feeding-doors at E. The blowing-engine is shown at F. Air is

forced into the furnace by means of the blowing cylinder, G, from which it passes into the receiver, H, and thence along a pipe into the heating-oven, I. Here a large surface of pipe is exposed, in arch-shaped rows, to the fire, which heats the enclosed air to 600° F. and upwards—a heat sufficient to melt lead. At this temperature, it enters the lower part of the furnace by means of the tuyeres, C. From 5000 to 10,000 cubic feet of air is discharged into the furnace per minute.

The operation of smelting is thus performed: the roasted ore, coal, and lime (flux) are either hoisted, or, if the nature of the ground permits, moved along a platform or gangway to the gallery near the top of the furnace, and fed into it at intervals through the openings in the side. We may here state that the furnace is kept continually burning except when under repair. The materials are of course raised to a very high heat, and gradually fuse into a softened mass. The clay of the ironstone then unites with the lime to form a coarse glass, or slag; the oxide of iron at the same time gives up its oxygen to the fuel, and allows the metal itself to collect on the hearth at the bottom of the furnace, united with about 5 per cent. of carbon, which it takes from the fuel, forming the variety called cast iron. Every twelve, and sometimes every eight hours, the metal is run off from the furnace, by means of a tap-hole at the bottom of the hearth, into rows of parallel moulds, called pigs, which are formed in sand, hence the name ‘pig iron.’ The slag which floats on the melted iron is run off by an opening at the top of the hearth. If the furnace is working well, the slag should be of a light-gray colour; a dark-brown or black colour shows that too much iron is passing into it.

The quantity of materials necessary to yield a ton of pig iron may be taken roughly as follows: 2 tons of calcined ironstone; 2 tons of coal, of which about 8 cwts. are required for the blowing-engine and hot-air pipes; and from 12 to 16 cwts. of broken limestone. The weekly produce of a single blast-furnace varies extremely—50, 100, and even the enormous quantity of 600 tons, is now occasionally obtained. The last amount, however, can only be procured from hematite ore.

There are about six varieties of cast iron, but it will be sufficient to describe three of them. No. 1 has a large and clear grain, is of a dark-gray colour, and contains its carbon for the most part mechanically diffused through its substance. It brings the highest price, is very fusible, and therefore largely used for castings, especially for those of a fine description. No. 4 has a much closer grain, is of a light, though dull gray colour, and contains its carbon partly diffused through it and partly in chemical combination. It is generally employed for conversion into malleable iron. No. 6 is called white or silvery iron, and has all its carbon chemically combined with the metal. It is not in much request, being usually produced when the furnaces are working badly. The qualities of the intermediate numbers differ only in degree from those described; thus, No. 2 is rather less gray, crystalline, and fusible than No. 1, and so on.

The hot-blast process which has been described...
above, was introduced, in 1830, by Mr James B. Nelson, of Glasgow, and has been productive of very remarkable effects on the iron trade. The whole invention consists in simply heating the air blown into the furnace, and yet the saving of fuel by this is about one half, and the production of iron, since it came into use, has increased at least fourfold. The 'cold blast' is still, however, to a limited extent employed, and produces the strongest iron, though necessarily at a much higher cost. The difference in quality appears to be caused by the greater heat in the case of the hot blast facilitating the passage of impurities into the iron.

We pass now to the consideration of malleable or wrought iron. It differs from cast iron in containing no carbon. The great object in the processes adopted for the conversion of cast into malleable iron, accordingly, is to deprive the former of its carbon. But it is also very desirable to get rid of deleterious ingredients, such as sulphur and phosphorus, which are generally present in minute quantities in the cast iron. The ordinary processes for the manufacture of malleable iron are refining, puddling, shingling or hammering, and rolling. The refinery is shown in section in fig. 2. It consists of a flat hearth, A, covered with sand or loam, and surrounded with metal troughs, B, through which a stream of water is constantly flowing, to keep the

![Fig. 2.—Refinery.](image)

sides from melting. C are the tuyères in connection with the blowing-engine. The cast iron is melted with coke on the hearth, and a blast of air kept blowing over it, which causes its carbon to unite with the oxygen of the air, and pass off as carbonic oxide gas. Oxygen also unites with silicon to form silica, and with iron to form the oxide. The silica of the sand uniting with oxide of iron, produces a slag of silicate of iron. The refined metal is finally run out in cakes on a bed of cast iron, kept cool by a stream of water. Being on' partially decarboxonised by this process, it is next broken up for the puddling furnace. About 10 per cent. of iron is lost in the refinery.

Fig. 3 shows a puddling furnace in longitudinal section. A represents the hearth; F the grate or fire-place; and C, the chimney, which has a damper at the summit, to regulate the draught. The grate is separated from the hearth by means of a bridge, D, which prevents the direct contact of the fuel with the iron. In the operation of puddling, about four cwt. of refined iron are placed on the hearth, and the heat raised till it is melted; the metal is then thoroughly stirred with an iron rod, so as to expose fresh surfaces to the oxygen of the air which is flowing over its surface. In this way, the carbon and other impurities are burned off, the fusibility of the iron is diminished, and ultimately it becomes

![Fig. 3.—Puddling Furnace.](image)

a spongy, granular mass. The whole charge of the furnace is now divided and formed into 'balls,' weighing from 80 to 110 lb. each, which are then raised to a welding heat, and taken singly to be shingled.

Instead of being both refined and puddled, pig iron is now largely decarbonised by means of the single process of 'boiling.' By this method, which is very similar to puddling, gray pig iron is deprived of nearly the whole of its carbon in the puddling furnace. In this way the metal requires to be raised to a higher heat and more frequently stirred than in ordinary puddling, so as to expel the escape of the larger amount of carbon; which has the effect of causing the metal to boil or bubble as it goes become decarboxonised. The boiling process requires about 24 cwt. of pig to produce a ton of bar iron, while the two processes of refining and puddling require 26 cwt. or thereby for a ton of similar bar iron. There is therefore least loss when the single operation of boiling is adopted, but, on the other hand, with it there is more tear and wear of the furnaces, and also more manual labour required.

The process immediately following the puddling or boiling is called 'shingling,' and consists in hammering the puddled balls with either the helve or steam-hammer, or in passing them through a 'shcerer' till they are sufficiently consolidated, and the greater part of the carbon has been expelled. Fig. 4 represents Mr Nasmyth's steam-hammer (see HAMMERS), which is now largely used in shingling as well as in heavy forgings. Puddled balls which have undergone shingling are called 'bolts' or 'bloom.' These are next passed through heavy rollers termed 'force' or 'puddle-bar rolls,' and reduced to the form of a flat bar. For all the better kinds of iron, the bars thus treated are cut into short lengths, piled together, reheated in a furnace, and again passed through the forge rolls. Once more the iron is cut, piled, and heated, and then passed through the 'mill-train,' consisting of what are termed the 'bolting' or 'rough rolls,' and finally through the 'finishing rolls.' Both these sets of rolls in the case of plates and sheets are plain, but in the case of bars are grooved, so as to form them into the required shape, such as flat, square, round, octagonal, or T-shaped iron. Fig. 5 indicates the arrangement and appearance of the 'rough' and 'finishing rolls' of a bar mill-train.

There is still another important variety of iron, viz., Steel, the manufacture of which remains to be described. Steel is essentially iron containing from 1 to 14 per cent. of carbon. Remembering that cast iron contains some 5 per cent. of carbon, the initiated reader will be a little astonished to learn that, in this country at least, most of the steel is made from malleable iron, seeing that, at some stage.
of the conversion of cast into wrought iron, the metal must have passed into the condition of steel. See Blistered Steel.

As blistered steel is full of cavities, it is necessary to render it dense and uniform, especially for the finer purposes to which steel is applied. By one method, it is converted into what is called 'shear steel'. This is done by breaking the bars of blister steel into short lengths, heating them in bundles, and partially welding with a forge-hammer. The rod so formed is heated again, and now brought under the action of the tilt-hammer—a heavy mass of metal weighing nearly 2 cwts. Here, by a succession of blows, it is formed into bars, which are much more compact and malleable than blister steel, and consequently better fitted for edge-tools and the like. Sometimes this kind is called tilted steel. By another method, viz., that of melting the blister steel in fireclay crucibles, and casting it into ingots, 'Cast Steel' (q. v.) is made. This is the best kind of steel, being finely granular, homogeneous, dense, and well adapted for the finest cutting instruments.

There are other modes of manufacturing steel, such as by the partial decarbonsation of cast iron on a charcoal hearth, a method largely practised on the continent.

Bessemer's method of producing malleable iron directly from crude pig iron is described elsewhere. See Bessemer's Process. Malleable iron made by Mr Bessemer's process is apt to be cellular and unsound, defects which the inventor has had great trouble in overcoming, if even now he has thoroughly succeeded. According to the same process, steel is made by introducing into the melted iron a given quantity of *spéleis* (a peculiar kind of cast iron), containing a known percentage of carbon; and so steel may be produced with any required proportion of carbon. The spéleis

Nevertheless, our manufacturers have hitherto thought it best to take the whole of the carbon out of the cast iron, and then restore a certain portion by heating with charcoal. This process of converting the iron like sugar in water, rendering it fusible and very liquid. Unfortunately, when pig iron containing phosphorus is operated on in this way, this injurious element is
not separated in a sensible degree, as is the case in the process of puddling; so that only those varieties of iron which are free from phosphorus, such as hematite pig, &c., can be advantageously used. Short as is the time since Mr Bessemer took out his patent, his process has been already put into practice on a large scale in England, France, Belgium, Sweden, and India.

We will now take a glance at the properties of each of these three kinds of iron, and to the purposes to which they are chiefly applied. Cast iron, as the crudest, cheapest, and most fusible, is used for the heavy portions of engineering work, such as bedplates for machines, cylinders, columns, cisterns, low-pressure boilers, water and gas pipes, rollers, girders, and the like. A large quantity is consumed in the manufacture of hollow-ware, which includes pots, pans, and other cooking-vessels. For ornamental objects, again, it is almost exclusively used, because here its property of being readily cast into moulds gives it a great advantage over the score of cheapness. Thus, fountains, statues, vases, gates, balustrades, garden-seats, candelabras, stoves, fenders, and many smaller decorated articles, even to the minuteness of a watch-glass and breastpin, are almost invariably made of cast iron.

Malleable iron differs considerably in its properties from cast iron. The latter is practically incompressible, but it can be comparatively easily torn asunder. Malleable iron, on the contrary, possesses great tenacity; it is, moreover, very malleable and ductile, especially at a high temperature, so that it can be rolled into sheets as thin as paper, or drawn into the finest wire. Further, it possesses the valuable property of being焊接, that is, two pieces can be completely united together by hammering at a white heat. Malleable iron is largely employed for the imnumerable variety of articles included under the general term 'hardware,' such as locks, keys, hinges, bolts, nails, screws, wires, and the so-called tin-plate, which is merely sheet iron dipped in melted tin. It is the mainstay of the railways and the electric telegraph, and is fast displacing timber as a material for bridges and steam-ships. A high interest is usually paid to the present time attainment of the manufacture of rolled armour-plates for war-ships. Several were shown in the late International Exhibition (1862) of large size; one of them measured 21 inches long, 6 feet 2 inches wide, and 61 inches thick, and weighed about 13 tons. The possibility of rolling such great masses of iron would, a few years back, have exceeded belief.

Steel possesses several valuable properties which do not belong to either cast or wrought iron. It is harder, denser, and whiter in colour. It is also more elastic, takes a higher polish, and rusts less easily. But its most characterastic property consists in its admitting of being tempered at will to any degree of hardness. If, for instance, a piece of steel be heated to redness and plunged into water, it is made hard and brittle; but if it be again heated and slowly cooled, its original softness is restored. By gently reheating the steel, it will acquire a gradual increase of hardness, indicating this degree with hardness, beginning with pale straw colour, and passing successively to full yellow, brown, purple, and finally to blue. The straw colour is the result of a temperature of about 440°F, the blue of about 570°F, the former being the hardest, and the latter the softest tempering.

The chief use of steel has hitherto been in the manufacture of needles, file-tools, and cutlery, for which its peculiar properties render it so admirably adapted. A large quantity is also consumed in the manufacture of needles and steel-pens. But the use of steel is no longer confined to the production of these comparatively small articles. By means of improved machinery and processes, steel is at present manufactured on a scale that was little dreamed of a few years ago, so that such objects as field-guns, railway-axles, tires, boiler-plates, and the like are not being made of this material. The superior tensile strength of steel, which is about double that of malleable iron, gives it a great advantage where lightness is required.

Perhaps few things illustrate more strikingly the great difference in value that exists between the same material according to the quality and form in which it is sent into the market. Thus, the average price of British pig-iron for 1861 was £3.2s. per ton, but some of it of very superior quality sold as high as £9 per ton. Malleable iron, in the form of bars may be had, while we write, as low as £2 per ton; Swedish bars are worth £15 per ton, and Lowmoor bars (the finest English iron) cost about £18. Superior sheet iron sells about £20, and fine wire for about £40 per ton. Steel, again, ranges from say, £30 per ton for blister steel, and £40 per ton for superior shear and cast steel in bars or rods, up to a considerably higher price for the finest in bar steel from India.

With reference to the statistics of iron, the present (1863) is a favourable time for comparing the produce of other countries with that of Great Britain, as authentic returns of their yield for last year have been prepared by several foreign governments for the International Exhibition. The following statement, which has been chiefly made up from the Jury Reports of the International Exhibition of 1862, shews the production of pig iron in the principal countries for 1861; Great Britain, 3,712,300 tons; France, 900,000 tons; Prussia, 397,400 tons; Austria, 310,077 tons; Belgium, 319,844 tons; Russia, 250,000 (17) tons; Sweden, 215,000 tons; Spain, 50,000 tons; Italy, 38,000 tons; United States (1860), 750,000 tons; Great Britain, France, Belgium, and Prussia have nearly doubled their annual yield within the last twelve years, and the produce of the British Islands is probably now about equal to that of all other countries put together.

3. Iron and its Physiological and Therapeutick Relations.—Iron is an essential constituent of the colouring matter of the blood-corpuscles of all vertebrate animals; and according to the best authorities, it is the material of which there are in blood-corpuscles, and the total quantity of this metal in the blood of a man weighing 140 pounds is about 38 grains. It is the presence of iron in the blood that communicates to the ashes of that fluid its reddish-brown colour, the iron being found in them as the peroxide. The ashes of the hair, of birds' feathers, of the contents of eggs, of the gastric juice, of milk, and indeed of most animal fluids, contain traces of this metal.

Nothing is known with certainty regarding the chemical condition of the iron in the animal body, that is to say, whether it is present as a protoporphyrine, a porphyrine, &c. It is introduced into the system with the food and drink, and any excess beyond the body's requirement is probably excreted in the urine. When an insufficient quantity is contained in the nutrition, chalybeate medicines become necessary. The iron that is set free within the system by the action of dilute hydrochloric acid is carried out of the system partly by the urine, partly by the colouring matter of the bile, which is highly ferruginous, and probably is in part eliminated by the hair. The exact part which the iron plays in the body is uncertain; but it is most probable that the power which the blood-corpuscles possess as oxygen carriers is mainly due to the presence of this substance.
IRON BARK TREE—IRON MASK.

When from any cause the blood-corpuscles are reduced in number, the state known as Anemia (q.v.) is produced, which is accompanied by general weakness and deranged functions. In this condition of the system the iron compounds are of incomparably more service than any other remedies. In Chlorosis (q.v.), which is closely allied to anemia, in anemorrhoea, and in certain painful nervous affections, the salts of iron are of especial service. The forms in which iron may be prescribed are very numerous, and vary considerably in their utility, according to the readiness with which they get taken up into the blood. Amongst the most generally used ferruginous medicines may be mentioned the tincture of the sesquichloride, the saccharine carbonate, the compound iron mixture (containing the carbonate), the sulphate, the potassio-tartrate, several citrates (especially the citrate of iron and quinine), &c. A course of Chalybeate Waters (q.v.) may often be prescribed with great advantage, when the patient cannot bear the administration of iron in its ordinary medicinal form.

IRON BARK TREE, a name given in Australia to certain species of Eucalyptus (q.v.), and particularly E. redina, on account of the extreme hardness of the bark. These trees attain a height of 50 or 100 feet, and a circumference near the base of 20 to 25 feet. The timber is very valuable for ship-building, and for other purposes in which hardness and durability are required. It withstands vicissitudes of weather for a great number of years without injury, or even underground remains uninjured for 45 years or more. (Bennett's Gatherings of a Naturalist in Australasia, 1860.)

IRON CROSS, a Prussian order of knighthood, instituted, on March 10, 1813, by Frederick William III., and conferred for distinguished services in the war which was then being carried on. The decoration is an iron cross with silver mounting. The grand cross, a cross of double the size, was presented exclusively for the gaining of a decisive battle, or the capture or brave defence of a fortress.

IRON CROWN, the crown of the ancient Lombardian kings, given, according to an unauthenticated tradition, by Pope Gregory the Great to Queen Theodolinda, and preserved till lately in the sacristy of the cathedral of Monza. Henry of Luxembourg, in 1311, is the first to whom it is known that it has been worn by a lawful and legitimate sovereign, who is known with certainty to have worn it. In 1539, it was removed by the Austrians to Mantua, and is now in Vienna. The outer part of the crown consists of a golden hoop, with enamelled flowers and precious stones, in form like an ancient diadem, within which is a thin plate or fillet of iron, which is declared by a tradition long opposed by the church at Milan, but adopted by the congregation dei sacri riti at Rome, to have been hammered from one of the nails of the True Cross; hence the crown is also called il naccio chiodo. When Napoleon I. was elected king of Italy in 1805, he took the relic from the tesoro of Monza, where it had remained from the time of Charles V., and crowned himself with it, disliking to receive it from the hands of a bishop; and at the same time, he founded an order of knighthood, taking its name from the iron crown. The reigning kings of Italy were to be grandmasters of the order, and the members of the order, at first 620 in number, and afterwards 985, were either dignitaries, commanders, or knights. The badge was the iron crown, and in the middle, the French eagle with raised wings. Round the rim of the crown was the motto, Deo me la diele, guai a chi la tocca ("God gave it to me, woe to him who touches it")—the words used by Napoleon when placing the crown on his head; and the front exhibited the effigy of Napoleon. The order—forgotten after the fall of Napoleon—was restored and remodelled in 1816 by the Emperor Francis I., who gave it the name of the Austrian Order of the Iron Crown, limited its members to

Iron Crown of Italy.

the 1st class to 29, of the 2d to 30, and the 3d to 50, exclusive of the princes of the imperial house. He introduced a new decoration in place of the former one, consisting of a gold crown of the same form with the iron crown, on which is placed the Austrian eagle on both sides, bearing upon the obverse a blue escutcheon upon the breast, with the letter F (Francis) in it; and on the reverse, the year 1816. The knights of the 1st class have, in addition, a silver star embroidered on the left breast, with the iron crown in its centre, and round its blue edge the words Austria et Austria. There is also a tricoloured costume, consisting of a yellow under-garment, white stockings and shoes, and a blue velvet cap and mantle.

IRON MASK, The Man with the. The story of the prisoner, so called, confined in the Bastille and other prisons in the reign of Louis XIV., has long kept up a romantic interest. The first notice of him was given in a work entitled Mémoires Secrets pour servir à l'Histoire de Perse (Amst. 1745—1746). According to this writer, he was the Duke of Vermandois, a natural son of Louis XIV. and de la Vallière, who, having given a box on the ear to his half-brother, the grand dauphin, had to explain it with imprisonment for life. The assertion was without foundation, for the Duke of Vermandois died in camp in 1683; but the confidence with which it was made caused a deep sensation, and the romance of Mouhy, L'Homme au Masque de Fer, which immediately followed (Hague, 1746), was read with all the more avidity that it was prohibited. Voltaire, in his Sicle de Louis XIV., treats the anecdote historically. According to him, the prisoner was young, and of a noble figure. In journeying from one prison to another, he wore a mask, and was at last transferred to the Bastille, where he was treated with great distinction; and so on.

In the meantime, an endless variety of hypotheses were formed on the subject. Some Dutch writers asserted that the prisoner was a young foreign nobleman, the chamberlain of Queen Anne, and the real father of Louis XIV. Lagrange-Chancel attempted to prove, in L'Annee Litteraire for 1759, that the Mask was no other than the Duke of Beaufort, the King of the Markets, as he was called.
a supposition conclusively set aside by Sainte-Aulaire in his History of the Fronde. The first authentic information with regard to the Iron Mask was given by the Jesuit Griflet, who acted for nine years as confessor in the Bastile, in his Traité des différentes Sortes de Prisons qui servent à établir la Vérité dans l'Histoire (Liège, 1769). He brought forward the MS. Journal of Dujouque, and the account of the prisoners, to which Saint-Mars arrived, on the 18th September 1688, from the Isle de Sainte-Marguerite, bringing with him in a litter a prisoner whom he had already had in custody at Fignerol. The prisoner’s name was not mentioned, but his face was always kept concealed by a mask of black velvet. The journal mentions his death on 19th November 1703, and that he was buried in the cemetery of St Paul. This was proved by the order of the Bishop for the parish of St Paul’s, where the body was interred, under the name of Marchiali. Griflet himself inclines under the supposition advanced in the Mémoires Secrets.

After long silence, Voltaire returned to the subject in his Essai sur les Meurs, but he brought forward nothing new. In the seventh edition of the Dictionnaire Philosophique, he related the story anew, under the head Anna, corrected his errors as to the person of the assumed Dujouque, and concluded with the assurance that he knew more about the matter than Griflet, but chose, as a Frenchman, to be silent. An addition to the article, apparently by the editor of the work, freely states the opinion that the supposed rebel was an elder brother of Louis XIV. The writer makes Anne of Austria to have had this son by a favourite, and being thus deceived as to her supposed barrenness, to have brought about a meeting with her husband, and in consequence born Louis V. The mystery is then explained by the fact that the existence of this brother when he came of age, and to have put him in confinement, to guard against any possible unpleasant consequences. Linguet, in the Bastille Démolie (The Bastile Exposed), describes this paternity to the Duke of Buckingham.

Saint-Michel published a book in 1790, in which he relates the story of the unfortunate being, and points to a secret marriage between Queen Anne and Cardinal Mazarin. What is remarkable is, that the court continued to manifest an interest in the matter, and took every means to keep the identity of the prisoner in the dark. When the Bastile fell, the prisoner’s room was eagerly searched, and also the areas near, but all was in vain. The Abbé Soulavie, who published Mémoires de Marchal Richelieu (Lond. and Par. 1790), tries to make out from a document written by the tutor of that unfortunate prince, that the Iron Mask was a twin-brother of Louis XIV. A prophecy had announced disaster to the royal family from a double birth, and to avoid this, Louis XIII had caused the last born of the twins to be brought up in secret. Louis XIV, learned of his brother’s existence after the death of Mazarin, and that brother having discovered his relation to the king by means of a portrait, was subjected to perpetual imprisonment. This view of the matter was that almost the most lamentable till the time of the Revolution. It is also followed in Zachokke’s German tragedy, and in Fourier’s drama, founded on the story.

The first conjecture of what seems the truth is contained in a letter dated 1770, written by a Baron d’Heis to the Journal Encyclopédique. The same is repeated by Louis Dutens in his Intercepted Correspondence (1789), who declares that there is no point of history better established than the fact that the prisoner with the Iron Mask was a minister of the Duke of Mauenta. This minister, Count Mattioli, had pledged himself to Louis XIV. to urge his master the duke to deliver up to the French the fortress of La Rochelle, according to the treaty of St. Germain, 21 May 1679, and conveyed to the fortress of Fignerol, which was his first prison. The conclusion of D’Heis and Dutens, that Mattioli was the Iron Mask, though acute, was only a conjecture. But the documents since discovered and published by M. Roux-Fazillac in his Recherches historiques et critiques sur l’Homme au Manque de Fer (Par. 1800), and by M. Delort in his Histoire de l’Homme au Manque de Fer (Par. 1825), leave little doubt on the subject. The reason why so much pains was taken to preserve the secret seems to have been that Mattioli being a minister plenipotentiary at the time, his seizure was a flagrant violation of the law of nations, which it was easier to be able to deny than to attempt to justify; and the denial once made, the honour of the court was involved in upholding it. See The True History of the Iron Mask, by A. Ellis (Lond. 1826); Quarterly Review, vol. xxxiii, pp. 206, 297.

IRONMONGERY, a term applied to the small manufactures of iron or hardware kept for general sale in shops.

IRONS, otherwise called Bilboes, are shackles of iron into which the ankles of a prisoner are fixed, and which slide on a long iron bar. Refractory sailors, convicts, and soldiers, who evince violent behaviour, and become unmanageable, are commonly put in irons, several being placed side by side along the same bar. In cases of extreme violence, the wrists may be similarly treated, but instances of this latter punishment are rare. The punishment of ‘putting in irons’ is more common in the navy than in the army.

IRONWOOD, a name bestowed in different countries on the timber of different trees, on account of its great hardness and heaviness.—Metrosiderus is a genus belonging to the natural order Mirtaceae, and is a native of Java and other eastern islands. It has ovato-lanceolate, shortly stalked, smooth, sharp-pointed leaves; and axillary, many-flowered, stalked cymes. Its wood is much valued by the Chinese for staves, and is also much used in India, and is imported into Britain in small quantities under the name of Ironwood. The bark is used in Japan as a remedy for diarrhoea and mucous discharges.—Mecura ferrca, a tree of the natural order Gutiferae, is a native of the East Indies, and is planted near Buddhist temples for the sake of its fragrant flowers, with which the images of Buddha are decorated. The flowers resemble small white rose and violet, and are fragrant with the deep crimson buds and shoots. The timber, known as L, is very hard, as is that of M. speciosa, another tree of the same genus and region.—The wood of Eupus undulata, of the order Diocremaceae, is called White Indian, the Cape of Good Hope. It is very hard and tough, and is chiefly used for axles, ploughs, and other agricultural implements.—The wood of Olea laurifolia, a species of olive, is called Black I. in the same country, and is used for the same purposes, and for furniture.

IRONY (Gr. eironia, from eiró, a dissembler) is the name given to that peculiar style of thought and expression by which words are made to convey a meaning exactly opposite to their literal sense. When skilfully used, irony is one of the most crushing
and irresistible figures of rhetoric. Instances will readily occur to every reader of history and literature. One of the most celebrated is that recorded in Scripture, where Elijah taunts the discomfited priests of Baal on Mount Carmel. The great master of irony in ancient times was Socrates, who, as has been happily said, raised it to the dignity of a philosophical method.

IROQUOIS. See Indians.

IRRATIONAL NUMBERS, a term applied to those roots of numbers which cannot be accurately expressed by a finite number of figures. For instance, \( \sqrt{2} \) is an irrational number. If the diameter of a circle is one foot, the circumference is an irrational number. Irrational numbers have been defined to be numbers which are incomensurable with unity. They are also commonly termed Surds.

IRA RAW'DI (said to mean, like Mississippi, 'father of waters'), the great river of Fischer India, is believed to rise in Tibet, near lat. 28° N., and long. 98° E., terminating in lat. 16° 20' N., and long. 96° E. Its course is pretty nearly due south, and has been estimated at 1200 miles in length. After receiving the Kung-thee, the Mongong-ze, and the Lung-chezee, it begins to form its delta about 17° N., which, between the Rangoon on the east and the Bassein on the west, comprises 10,000 square miles of forest and pasture, curiously intersected by an inextricable network of the smaller branches of the stream. With regard to facilities of communication, the I. appears to be decidedly superior to the Indus and the Ganges, being navigable even at low water, for vessels of 200 tons as far as Ava, which is 400 miles from the sea, and for canoes as far as Bhamo, which is 180 miles higher up. The I. successively traverses China, Burmam, and Pegu. As the region last mentioned, forming the lowest part of its basin, is a province of British India, the I., as a whole, may be said to be virtually under the control of England. In both our Burmese wars, it constituted the line of advance for our armies.

IRRREDUCIBLE CASE occurs in the solution of cubic Equations (see \( x \)) by Cardan's method when \( p \) is negative, and \( p^2 + 27 > 4 \) (abstractive from the sign). These conditions render \( \sqrt[3]{\frac{4}{27}} \) an imaginary quantity, and thus Cardan's formula fails in its application. The difficulty is got over by the aid of trigonometry.

IRRELEVANT, a term used in Scotch law to denote that what is said or put forward by an opponent in an action has no bearing on the subject, even if it were true. The corresponding term, in English law, is the pleading containing the irrelevant matter is demurriable.

IRRIGATION (Lat. waterings), a method of producing or increasing fertility in soils by an artificial supply of water, or by inundating them at stated periods. Irrigation was probably first resorted to in countries where much of the land must otherwise have remained barren from drought, as in Egypt, where it was extensively practised nearly 2000 years before Christ, and where great systems of canals and artificial lakes were formed for the purpose. It has also been long resorted to for the irrigation of large districts, existed in times of remote antiquity in Mesopotamia, Persia, India, China, and some other parts of the East; and in such of these countries as have not entirely lost their ancient prosperity, such works still exist. In many parts of the world, the necessity of irrigation, at least at certain seasons of the year, is so strongly felt, that the agriculture even of comparatively rude tribes depends on the facility with which it can be accomplished. Some plants also require a very abundant supply of water, and irrigation has become general where their cultivation prevails. This is particularly the case with rice, the principal grain of great part of Asia. Irrigation is supposed to have been introduced into Britain by the Romans, but was very little practised till the beginning of the present century. In Europe, irrigation prevails chiefly in the south, where it was extensively practised by the Romans, from whom it was adopted by the Lombards; and it is most extensively practised in Lombardy, and in some parts of Spain and of the south of France, so that the great plains and valleys of the Po, Adige, Tagus, Douro, and other rivers, are almost entirely subjected to an systematic irrigation, which prodigiously increases their fertility. The extent of irrigated land in the valley of the Po is estimated at 1,000,000 acres, and the increase of rental thus caused, £300,000.

Irrigation in Britain, and in most parts of Europe, except Lombardy, is almost exclusively employed for the purpose of increasing the produce of grass by converting the land into water-meadows. The value of it, even for this one purpose, has not yet been sufficiently understood. Poor heaths have been converted into luxuriant meadows by means of irrigation alone. But in the countries in which irrigation is most extensively practised, the production of all crops depends on it.

The irrigation of land with the sewage water of towns is, under another name, the application of liquid manure. In no small degree the water of rivers and of springs depends on its organic and mineral constituents for its fertility, so that the application of it is not in principle different from that of liquid manure; but it must be borne in mind that the mere abundance of water itself is of great importance for many of the most valuable plants, as the most nutritious substances brought into contact with their roots are of no use to them unless in a state of solution; whilst it is an additional recommendation of irrigation, that the supply of water, most favourable to the growth of many valuable plants, is destructive of some which in many places naturally encumber the soil, as heath, broom, &c. The water which is used for irrigation should be free from mud and such impurities as mechanically clog the ground, or cover up the "hearts" of plants, and interfere with their growth. Irrigation is far from being so extensively practised in Great Britain as seems desirable. The extent of water-meadows in England is stated to be not more than 100,000 acres. They are mostly confined to the west and south of England. Individual farms, irrigated with sewage water, are to be met with in Nottinghamshire, Staffordshire, Lancashire, Cheshire, and in one or two counties in Wales. The most successful instance, however, of sewage irrigation in Great Britain is to be found near Edinburgh, where an extensive tract of meadows, lying between Portobello and Leith, yield a rent of £40 to £40 an acre; the grass is cut from three to five times a year, and as much as ten tons an acre have been obtained at a cutting. See Sewage, Manure.

The method of forming and laying out water-meadows will be best gathered from the following sketch of the different species of irrigation as practised in this country.

1. Bed-work Irrigation.—This method can only be conveniently applied to grass at ordinary level. It consists in laying out the ground into sloping beds or ridges, from 30 to 40 feet wide, according to the nature of the soil, having their
IRRITABILITY—IRVINE

upper ends lying in a gentle slope from one side to the other of the meadow. Along the upper ends of the beds is drawn the drain or conductor, which brings the water from the reservoir or river, as the case may be; and this conductor must be tapered off at its further end, in order that the diminished supply of water may still overflow. From this conductor, small drains, called feeders, are led down along the crown of each ridge. In the lowest part of the meadow, a main-drain, which must be made so as to carry the conductor, is cut across the lower ends of the beds, and the water, after having served the purpose of irrigation, is led into it, by means of small drains cut in the furrows. The feeders should, like the conductor, taper towards their further extremity, both for the purpose of retarding the velocity of the water, and of preserving a continual overflow along their whole length. On the contrary, the small drains should gradually widen towards a lower extremity, where they meet the main-drain. The dimensions and inclination of the conductor and feeders should be so regulated to the water-supply, that the beds can be wholly laid under water to the depth of about 4 inches. The expense of bed-work irrigation ranges from £20 to £40 per acre.

2. Catch-work Irrigation differs materially from the former; it can be applied to land whether level or not, costs only £4 per acre, and, in the opinion of some men, is quite as effective. The conductor formed as before is led along the highest side of the field, then with the aid of a level, a succession of perfectly level gutters (which, of course, must be winding), are drawn across the field in the same direction as the conductor, and not more than ten yards from each other; these are crossed by feeders running from the conductor to the lowest side of the field, thus forming a kind of checkwork. The main-drain is made as before, and the feeders, which taper towards their lower extremity, serve for small drains. This plan is more effective than the former, when the supply of water is limited; and as it can be applied to a hillside as well as to a level field, its application is rapidly extending.

3. Subterraneous Irrigation is only applicable to perfectly level fields, and consists, first, of ditches being formed all round the sides. At right angles to these, drains or conduits are drawn across the field, parallel to each other. When the land is to be irrigated, water is let into the ditches, and thence to the cross-drains, till it rises to the level of the surface; and when the ground is to be laid dry, the side-ditches are emptied by slices. The bottom of the ditches is below the level of that of the cross-drains, so that they serve both as conductor and main-drain. The first two methods of irrigation are only applied to pasture-lands, and the third to fields and drained meadows, which are apt to become parched in summer; the last method would be very valuable for land under green crop in cases of drought.

The management of water-meadows requires great skill and care, but we can only here mention the chief points to be attended to, which are these: the water, if limited in quantity, must be confined to a part which it can effectually irrigate; too much water, or too rapid a flow tends to wash away the soil; the meadow may be kept under water for a fortnight at a time, in November, but the time should be diminished till April or May, when regular watering should cease; after the grass is cut or eaten down, the water may be let on for a few days; and it is necessary that between the times of watering the land should be laid perfectly dry. Special precautions are necessary in winter, to guard against any bad effects resulting from frost, &c.

IRRITABILITY in Plants, a term employed to designate phenomena very interesting and curious, but which none connected with vegetable life are more imperfectly understood. Such are the phenomena of what is usually called the "Sickness of plants"; the motion of the Speres (q.v.) of many cryptogamic plants by means of cilia; the motions of Oscillariolus, Didymococcus, and others of the lowest Algae; the successive approaches of the stamens of Papaver somniferum to the pistil; the movements of the leaves of the Moving Plant (q.v.) of India; and those caused by agitation or by the touch of a foreign body in the leaves of Sensitive Plants (q.v.), of the Dianthus or Venus's Fly-trap, &c., in the stamens of the Barberry, Schiаnthus, &c., and in the stigma of Minnus, &c. Many explanations have been proposed of these phenomena, but none satisfactory. Of the existence of anything analogous to the nervous system of animals, which has been imagined, there is not the slightest proof, closely as some of the phenomena resemble those of animal life. The explanations which have been proposed are no better than mere guesses. See MUSCLES.

IRRITANT (Lat. irritus, of no effect), a term in Scottish law, to denote something of the nature of neglect or injury which destroys or makes void an existing right; in English law it is called Forfeiture. Thus, there is the irritancy of a tenant's not paying the duty of the herit. -IRRITANT CLAUSE, in a Scotch entail, is a clause which makes void certain prohibited acts of the heir of entail, such as selling the property.

IRRITATION is the term applied to any morbid excitement of the vital actions not amounting to inflammation; and it is often, but not always a cause of that condition.

In cases of irritation, remarkable sympathetic symptoms are often observed. Thus, irritation of a calculus occasions intense sickness and vomiting. But of all sources of sympathetic morbid affections of this class, irritation of the stomach and intestines is at once the most common and the most important. The ordinary sick headache is the most frequent form of sympathetic affection; but in certain morbid conditions, and especially in the periperal state, the symptoms may be as pretty close to resemble those of acute inflammation of the peritoneum, the heart, the pleura, or the membranes of the brain. See also to Dr Marshall Hall that the irritation is mainly due to the particular case in which irritation so closely resembles inflammation. He has shewn that blood-letting affords a certain means of diagnosis in these cases. In true inflammation, 30 or 40 ounces of blood may be taken before there are any symptoms of faintness; while in irritation, the loss of a very few ounces (nine or ten) of blood will cause the most decided syncope.

IRISH, a river of Siberia, an affluent of the Obi.

IRVINE, a royal and parliamentary burgh, seaport, and market-town of the county of Ayr, Scotland, is situated on both banks, but principally on an eminence on the right bank of the river Irvine, which is here crossed by a handsome stone bridge, about a mile above the embouchure of the river in the Firth of Clyde. It is 11 miles north of Ayr, and 29 miles south-west of Glasgow by railway. The harbour has now become so much sanded up, as only to admit vessels of about 100 tons burden. The 'Academy' is one of the educational institutions in the west of Scotland. Shipbuilding, and the manufacture of book-muslins, jacquets and checks, are among the branches of
CHAPTER VI.

In 1830, the Life of Washington was published in 1855—1859. An edition of his works in 15 vols. reached a sale of 250,000 vols. He spent the last 18 years of his life at the "Cottage in the Hollow," on the banks of the Hudson, near Tarrytown, with his nieces, where he died suddenly of disease of the heart, November 28, 1859. He was never married.

IRVING, REV. EDWARD, was born in the town of Annan, Dumfriesshire, August 15, 1792; studied at the university of Edinburgh, and took his B.A. in 1813, his M.A. in 1815, and his B.D. in 1822. He was ordained in the Church of Scotland, and appointed assistant in 1819 to Dr Chalmers, then a minister in Glasgow. His sermons did not prove very popular, Chalmers himself was not satisfied. In 1822, he received a call to the Caledonian Church, Harrow, London, which he accepted. His success as a preacher in the metropolis was such as was never witnessed before or since. After some years, however, the world of fashion got tired of him; but it was not till his more striking singularities of opinion were developed that fashion finally deserted him. At the close of 1825, he began to announce his convictions in regard to the second personal advent of the Lord Jesus in which he had shown a firm believer, and which he declared to be near at hand. This was followed up by the translation of a Spanish work, The Coming of the Messiah in Majesty and Glory, by Juan Josephee Ben Ezra, which proceeded to be widely used by a Christian advocate in the city of New York. In reality, the composition of a Spanish Jesuit.

The introductory preface is regarded as one of his most remarkable literary performances. In 1828, appeared his Hou trances on the Scriptures. He now began to elaborate his views of the second personal advent of Christ, asserting with great emphasis the doctrine of his oneness in all the attributes of humanity. The language which he held on this subject drew upon him the accusation of heresy; he was charged with maintaining the sinfulness of Christ's nature, but he paid little heed to the alarm thus created. He was now deep in the study of the prophecies; and when the news came to London in the early part of 1830, of certain extraordinary manifestations of prophetic power in the west of Scotland (see Irvingites), L. was prepared to believe them. Harassed, worn, believing in his most sacred desires for the regeneration of the great Babylon in which he dwelt, branded by the religious public, and satirized by the press, the great preacher, who strove above all things to be faithful to what seemed to him the truth of God, grasped at the new wonder with a passionate earnestness. Matters soon came to a crisis. L. was arraigned before the presbytery of London in 1830, and convicted of heresy; ejected from his new church in Regent's Square in 1832; and finally deposed in 1833, by the presbytery of Annan, which had licensed him. His defence of himself on this last occasion was one of his most splendid and sublime efforts of oratory. The majority of his congregation adhered to him, and gradually a new form of Christianity was developed, commonly known as Irvingism, though L. had really very little to do with its development. Shortly after, his health failed, and in obedience, as he believed, to the Spirit of God, he went down to Scotland, where he sunk into that consumption which consumed him at Glasgow, December 8, 1834, in the 42d year of his age.—See Carlyle's Miscellaneous Essays, and Mrs Ophian's Life of Edward Irving (London, 1862).

IRVINGITES, the common but improper designation of a body of Christians who call themselves collectively the Apostolic Catholic Church. Their
ISAAC—ISABELLA.

existence as a distinct sect dates from about 32 years ago. In the winter of 1829—1830, the Rev. Edward Irving (q. v.), then a minister of the Scotch Church, Regent Square, London, delivered a series of lectures on spiritual gifts, in which he maintained that those which we are in the habit of calling 'extraordinary' or 'miraculous,' were not meant to be confined within the walls of a church, but to be continued through the whole period of the present dispensation. About the same time, as if to confirm the views of the great preacher, there occurred at Port-Glasgow, in the west of Scotland, certain strange phenomena. It was alleged that miraculous acts of healing had happened, and that the gift of tongues had reappeared. After what seemed to be a sufficient investigation on the part of some of the members of Mr Irving's church, it was concluded that the manifestations were genuine. Similar manifestations shortly after occurred in his own church, which were also pronounced to be genuine. They were held to be of two kinds: 1st, speaking in tongues, and 2d, prophesying. As the former bore no resemblance to any language with which men were conversant, it was believed to be strictly an 'unknown tongue,' the Holy Ghost 'using the tongue of man in a manner which neither his own intelect, nor that of any other man comprehend.' The latter, 'prophesying,' consisted chiefly of 'exhortations to holiness, interpretations of Scripture, openings of prophecy, and explanations of symbols.' After some time, Irving was deposed from his office for having the Church of Scotland, but meanwhile the religious opinions with which his name was associated had been assuming a more definite and ecclesiastical shape. The final result was the Apostolic Catholic Church, the constitution of which is briefly as follows: There are, as in the apostolic times, four ministries: 1st, that of 'Apostle;' 2d, that of 'Prophet;' 3d, that of 'Evangelist;' and 4th, that of 'Pastor' or 'Angel.' The apostles are invested with spiritual prerogatives; they alone can convey the Holy Ghost by the laying on of hands; to them the mysteries of God are revealed and unfolded to the church, so that they may be described as sacred 'mediums' of communication between Heaven and earth. Nothing that transpires in any church in the way of 'prophetic utterance' can be authoritatively or infallibly explained save by them; and the various 'angels' of the churches are beneath them all, with such utterance under their cognizance, in order that they may be rightly interpreted. The function of the 'prophet' has been already indicated. The work of an 'evangelist' mainly consists in endeavouring to 'bring in' those who are without; while the 'angel' of the Catholic Apostolic Church corresponds with the pastor or teacher of other Christian denominations. The ministers of each congregation comprise an angel with six ruling presbyters; various assistant ministers, deacons and deaconesses; evangelists, and those who may have prophetic or other gifts. This ministry is supported by tithes, the people giving a tenth of their income for the support of the priesthood. Church affairs are managed by a council of ministers of all classes, whose selection and arrangement are conceived to have been foreshadowed in the structure of the Mosaic Tabernacle.

The Catholic Apostolic Church does not differ from other Christian bodies in regard to the common doctrines of the Christian religion; it only accepts, in what it considers to be a fuller and more real sense, the phenomena of Christian life. It believes that the wonder, mystery, and miracle of the apostolic times were not accidental, but are essentially inseparable characteristic features of the divine institution of the church of God, and its main function is to thoroughly prepare a people for Christ when he comes in his kingdom. A very special feature of the Catholic Apostolic Church is its extensive and various literary, scientific, and educational activities. It has published a series of periodicals and books, which are known for their interest and ability to entertain very much the same view as the Roman Catholic Church.

The Catholic Apostolic Church has established itself in England, Canada, the United States, Prussia, France, and Switzerland, but the congregations are not numerous.

ISAAC ('he will laugh'), a Hebrew patriarch and pastoral chief, was the son of Abraham and Sarah, and half-brother of Ishmael. His birth happened when both his parents were advanced in age. The incidents of his life, as recorded in Genesis, are well known. He died at Hebron, aged 180 years, leaving two sons, Jacob and Esau. I. 's character has always been very differently interpreted. There has been called by some his mild and gentle disposition, simple pastoral piety, others have termed weakness and want of character. His (for the most part) blameless ways, however, call forth our love and respect. The Midrash associates him in allusion to Gen. xxiv. 63, the institution of the afternoon prayer.

ISAAC I., COMMENT, emperor of Constantinople, was the first of the family of the Comneni who attained to that dignity. His father Manuel, his brother John, and himself were employed in important military and civil capacities by Basil II. (976—1025); but during the reign of the latter's imbecile and tyrannical successors, in whose eyes he was esteemed from any one to the present, in wisdom and ability, I. was exposed to considerable danger. Such, however, was his prudence, and the affection of the people for him, that the emperors unwillingly suffered him to live unmolested; and on the deposition of Michael VI. (1056—1057), I. was elevated to the vacant throne. On his accession, he found the affairs of the empire in what was by this time their normal condition; rebellion within, aggression without, and the treasury exhausted. He succeeded in establishing a system of great economy in all branches of the administration, and in order still further to lighten the taxes on the people, called upon the clergy to contribute their share. But the clergy, then as now, refused to be denominated the property of any such burden, and the patriarch Michael is reported to have even threatened him with deposition. But death delivered I. of this formidable opponent, and the clergy were compelled to comply. In 1059, he repelled the Hungarians, who had encroached upon his possessions in the north-west; but soon afterwards, to the great grief of his subjects, he was attacked by a violent fever, and believing his dissolution approaching, appointed his famous general, Constantine Ducas, as his successor. He, however, recovered from his illness, but resigning the crown, retired to a convenant, where he lived for two years in the odor of sanctity, and died in 1061. He was one of the most virtuous emperors of the East, and was celebrated for great learning, wisdom, and prudence, united an administrative ability and energy, that would, had his reign been of longer duration, have gone far to regenerate the affairs of the empire. Nor was he deficient in literary attainments. We still possess by his Scholia—hitherto unedited—on Homer, his favourite author; furthermore, a work, Characteristica, scil., of the Greek and Trojan chiefs mentioned in the Iliad; and a work, 'On the Works of Homer.'

ISABELLA of Castile, (died 1482), daughter of Ferdinand II., king of Castile and Leon, and in 1469 married
ISABELLA THE CATHOLIC—ISCHIA.

Ferdinand V., surnamed 'the Catholic,' king of Aragon. On the death of his brother, Henry IV., in 1451, she ascended the throne of Castile and Leon, to the assassination of her sister Joanna. She had won the support of great part of the states of the kingdom during her brother's life, and the victorious arms of her husband compelled the consent of the rest (see Ferdinand I.). I was a woman of religion, temperance and taste, and possessed no inconsiderable beauty and much winning grace, although proud, ambitious, and deficient in true womanly gentleness. She was always present in meetings of the Diet, an assembly, on the use of her name along with that of Ferdinand in all public documents. She died at Medina del Campo, on 26th November 1504, after having extorted from her husband, of whom she was always jealous, a promise, confirmed by oath, never to marry again.

Order of Isabella the Catholic.

ISA'I'AH (Heb. יְשַׁעֵיהוּ, 'Salvation of God'), the most sublime of the Hill, an prophet, was the son of one Amoz. He uttered his oracles in the reigns of Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah. Regarding his outward life, almost nothing is known. He appears to have resided at Jerusalem, in the vicinity of the temple, was married, and had three sons, given him, he says, 'for signs and for wonders in Israel.' The period of his death is not known, but according to a rabbinical legend, apparently accepted by the Rabbinists, Eipsthe to the Hebrews (xi. 37). (Sanh. 103 b, §c), he was sown asunder by order of King Manasseh, who abhorred his oracles (cf. Jos. Ant. x. 31). If this statement is well founded, I. must have been nearly 100 years old when he was barbarously murdered. The prophecies of I., viewed in their literary aspect, do not exhibit a continuous unity of design; they consist, of a series of 'visions' beheld at different times, and arranged neither exactly in chronological nor material order. The compiler or editor of the whole is believed by many not to be I. himself. Verse 38th of chap. xxxvii. is regarded by the majority of scholars of note as conclusive proof of a later hand. The grand controversy, however, is not concerning the arrangement of these prophecies, but concerning their authorship. Did they all proceed from one and the same person, or are different authors discernible? Orthodox critics maintain the unity of authorship, and assert that I. if he did not edit, certainly wrote the whole 66 chapters. The first who doubted this was the German scholar Koppe (1779—1781), who suspected that the last 27 chapters (40—66) were the work of a later hand. He was followed by Doderlein, Eichhorn, and Justi, and the same view has been substantially adopted by Paulus, Bertholdt, De Wette, Gesenius, Hitzig, Knobel, Umbreit, and Ewald. The chief arguments against the Isaiah-authorship are: 1. That the subject-matter of these burdens relates to what happened long after I.'s death. 100 years at least, viz., the redemption of the Jews from captivity, consequent upon the overthrow of the Babylonian monarchy by the Medo-Persian army. 2. That the writer speaks of the exile as something present, and of the desolation of Judah as a thing that had already taken place. 3. That Cyrus is mentioned by name, and an intimate knowledge exhibited of his career. 4. That this extraordinary minute acquaintance with the condition and habits of the exiles is shown. 5. That the sentiments are far more spiritual. 6. That the style is totally different from the other parts of the book, is embittered, gloomy, and desolate. In these prophecies, we have the first distinct and vivid announcements of a Messianic deliverer (whence I. has been called the 'Evangelic prophet'). As, however, they are found chiefly in the last 27 chapters (the supposed work of a Deuter-Isaiah), it has raised a question, by those who do not believe in prophecy in the usual sense, whether the 'deliverer,' who redeems the people by his own sufferings, is a literal prediction of Jesus Christ, or the Messianic prophet, or only a personification of the sanguine hope of deliverance that animates his patriotic and religious soul.

The style of I. possesses an astonishing richness and variety. It reaches the pinnacle of grandeur, and melts into the softest pathos. Ewald, a master of aesthetic as well as of philologic criticism, attributes to him 'the most profound prophetic excitement and the purest sentiment, the most indefatigable and earnest, but granite-smooth, flowing all perplexities and changes of outward life, and that facility and beauty in representing thought which is the prerogative of the genuine poet . . . .

In the sentiments which he expresses, in the topics of his discourses, and, in the manner of expression, I. uniformly reveals himself as the kingsy prophet' (Propheten des Alten Bundes, vol. i. p. 166, &c.). Among the chief commentators on I. are Jerome, Aben-Ezra, Alumbach, Vitringa, Lowth, Henderson, Calmet, Hitzig, Rosenmüller, Gesenius, Hengstenberg, and Alexander.

YSAR, or ISER, a river of Germany, rises in the Tyrol, to the north of Innsbruck, and, entering Bavaria, flows generally in a north and north-east direction, and joins the Danube at Deggendorf, after a course of about 180 miles. Munich and Landshut are situated upon its banks. In the first part of its course, it is an impetuous mountain torrent; and even after it leaves the Alps, it has many rapids and islands, but for a great part of its course it is navigable for boats. Much wood is floated down the I. from the mountains.

TSCHIA (the ancient Φαναριον), an island situated between the Bay of Naples and that of Gaeta. It is about 24 square miles in extent, and has a population of 25,900 inhabitants. I. is a favourite place of summer resort, and is noted for the excellence of its mineral waters, and numerous springs, the great richness of its soil, the exquisite flavour of its fruits and wines, and the enchanting character of its scenery. Its highest point is the volcanic Mount Epomeo, above the level of the sea, of which the eruptions have been numerous and disastrous; that of 1302 was of two months' duration, and occasioned a serious loss of life and property. The Lake of Ischia appears to occupy an extinct crater of the volcano, and abounds in fish.
ISCOH—ISIDORE OF SEVILLE.

ISCHEL, a small town of Upper Austria, surrounded on all sides by gardens, is finely situated on the river Traun, amid magnificent Alpine scenery, 28 miles east south of Salzburg. It is the chief town of the district called the Salzkammergut (q.v.). The situation of I., and the salt baths which were established here in 1222, have attracted to it vast numbers of visitors. The emperor and many of the Austrian nobility have built villas here, and the town has also acquired celebrity from having been the scene of various diplomatic conferences. Pop. 10,900.

ISEO, LAKE, or LACUS SEVINUS, a lake of Northern Italy, situated between the provinces of Bergamo and Brescia. Its extreme length from north to south is about 20 miles; its average breadth, 6 miles; and its greatest depth, 954 feet. On its banks is situated the town of Iseo. The lake is fed by the rivers Oglio and Brolzzen. The surrounding scenery is highly interesting, broken into picturesque heights, and studded with fine villas, vineyards, and olive-gardens.

ISERE, a river of the south-east of France, rises in Savoy, at the western base of Mount Isere, flows in a south-west direction through Savoy, and through the departments of Isere and Drome, and joins the Rhone 8 miles above Valence. Its entire length is about 190 miles, for the last 50 of which it is navigable, but not without difficulty, as its channel is interrupted by shoals and islands.

ISERRA, a department in the south-east of France, is bounded on the N. and W. by the river Rhone, on the E. by the department of Savoie, and on the S. and E. by those of Drome and Hautes-Alpes. Area, 2,078,799 acres, of which nearly a half is in arable land, and a fifth in woodland. Pop. (1862) 577,748. The surface is level in the north-west, but becomes mountainous as one proceeds south, where the scenery is very imposing. Mount Oisans, on the south-eastern border, is 12,604 feet high. The chief rivers, besides the Rhone, are the Isere, from which the department derives its name, and its affluent the Durance and Romanche. The department of I. is one of the richest of France in mineral productions. Mines of iron, lead, copper, and coal are worked, and gold and silver occur. The vine is carefully cultivated in the valleys; 5,324,000 gallons are said to be produced annually. Arrondissements, Grenoble, La Tour-du-Pin, St Malo, Seguret, Grenoble, capital.

ISERLOHN, an important manufacturing town of Prussian Westphalia, is situated in a picturesque and mountainous district, on the Baar, a tributary of the Ruhr, 18 miles west of Arnsberg. The industry of I. is chiefly directed to the manufacture of hardware of various kinds, especially of brass and bronze articles. Pop. 13,429.

ISERNIA (anc. Esernia, a city of the Samnitians), a town of Naples, in the province of Molise, is situated in a commanding position on the crest of a hill, 24 miles west of Campobasso, and is surrounded by scenery of romantic beauty. The modern town consists chiefly of one long and narrow street, and is surrounded by walls. Among numerous other antiquities is a subterranean aqueduct, hewn in the solid rock, which still supplies the fountains and manufactories with water, and remains uninjured throughout its entire course of one mile. I. was much injured by an earthquake in 1603, when some of its finest buildings were ruined. Woolens, paper, and earthenware are here manufactured. Pop. 7,930.

ISHIM, a river of Siberia, an affluent of the Ola (q.v.).

ISHMAEL (Heb. Yishmael, 'God will hear'), the first-born of Abraham, by Hagar, the Egyptian handmaid of his wife Sarah. His character is found foretold before his birth by an angel, who met Hagar sitting by a well in the wilderness on the way to Shur, whither she had fled to avoid the harsh treatment of her mistress: 'And he will be a wild ass of a man: his hand against him; and he shall dwell in the presence of all his brethren' (Gen. xvi. 12). Expelled from his father's house, along with his mother, when he was about the age of 13, he went into the southern wilderness where he grew up to manhood, and became famous as an archer. Scripture represents I. in a not unfavourable light, and it was predicted that he should become a great nation. This 'great nation' is commonly believed to be the Arabian; and there is, however, not a shadow of reason, as all scholars now admit, for the notion that the founders of the great Joktanite and Cushite monarchies in the south of Arabia are to be sought in Ishmaelites or Ishmael's descendants. I. is represented as the father of the Arabian race and the forefather of all the Arabian nations. Whether the Ishmaelites and the Edomites are included in this descent is doubtful. The theory gains credit from the account in Scripture of the character and habits of I. and his descendants, which, according to these accounts, are in every way less inferior to the others. From a very early period the Ishmaelites and Edomites were assimilated to the other tribes of the Arabian peninsula, their society and state, down to the great constitutional change of

ISIDORE OF SEVILLE (ISIDORUS HISPALENSIS), one of the most distinguished ecclesiastics of the 6th century. He is particularly remarkable as among the earliest representatives of the church of Spain, and of that great movement in the Western Church by which the doctrinal and moral system of Christianity was brought into harmony with the habits and institutions of those various races and nationalities which, by successive immigrations and wars, were eventually erected into the Hispano-Gothic kingdom, exercised so powerful an influence on what is called Latin Christianity. He was born about 569 or 570, at Carthagena, in Spain, where his father, Severian, was bishop. Two of his brothers, Fulgentius and Leander, were, like himself, bishops, the first of Carthagena, the second succeeding him in the see of Seville. The episcopate of I. is rendered notable by the two half-ecclesiastical, half-civil councils of Toledo in 619 and in 633, which were held under his presidency, and the canons of which may almost be said to have formed the basis of the constitutional law of the Visigothic kingdom, both for church and for state, down to the great constitutional change of...
ISIDORIAN DECRETALS—ISIS.

the 15th century. He also collected with the same object all the decrees of councils and other church laws anterior to his time. His death, which occurred in 636, forms one of the most remarkable scenes in early Christian history. When he became sensible of the necessity of compiling a work, he did not limit his to his bedchamber, exhorted them to mutual forbearance and charity, prayed their forgiveness for all his own shortcomings in his duty, and directed all his property to be distributed among the poor. His works, in the form of a compendium of knowledge—doctrinal, ascetical, liturgical, scriptural, historical, philosophical, and even philosophical—were first published in 1380; but the most complete edition is that of Arevalo, 7 vols. 4to (Honey, 1707—1866). We are indebted to I. for many fragments of Greek and Latin authors, among the number several of whom hardly any other remains have been preserved.

ISIDORIAN DECRETALS, also called FALSE DECRETALS, a spurious compilation of the 9th c. which, by a singular combination of circumstances, obtained currency in the Western Church, and continued for several centuries to enjoy unquestioned authority. Up to the 9th c., the only authentic collection of decreets, that of Dionysius, the 2nd bishop of Rome, commenced with the decrees of Pope Siricius in the end of the 4th century. The so-called Isidorian Decretals stretch back through the predecessors of Siricius to Cyprian, and are the first to add only a few rules, or fewer than 50 decreets or epistles anterior to the time of Siricius. In a later part of the Isidorian collection, moreover, are interpolated nearly forty similar documents, unknown till the time of that compilation. All these documents are presented not merely as authentic, but as the genuine productions of the particular popes to whom they are attributed. The subject-matter of these decreets is most diversified, comprising the authority and practice of various Christian sects, persons, and communities, and that the author believed that he "was not asserting for Rome any prerogative which Rome herself had not claimed" (Latin Christiand, ii. 373). Catholic historians, indeed, go further, and while they admit and defend the clausum fraud, contend that the easy and universal acceptance which the decreets met, furnishes the strongest presumption that the discipline which they have elaborated and methodised, was already in full possession, although without the formal and written law which the daring adventurer attempted to provide in the decreets of the early pontiffs.

It is curious that the author, the place, and the date of this singular forgery are still a matter of uncertainty. It is certain that it did not come from Rome; and the most probable conjecture assigns its origin to Mentz, at some time between the years 840 and 847. It was introduced under the name of a collection designated the "collection of the church of Mentz," or the "manuscript collection known as his," and was believed to have been brought from Spain by Rieulf, the Archbishop of Mentz. It is hardly possible, in an age of discovery and crusades, that with the first appearance, even the most superficial inquiry, or the slightest critical investigation of the historical sources, would have sufficed to detect the fraud.

"It is impossible," says Dean Milman, "to deny that at least by citing without reserve or hesitation, the Roman pontiffs gave their deliberate sanction to this great historic fraud;" and yet it is equally impossible to fix the limit beyond which, in an age so uncritical, literary or historical credulity might not be carried without provoking its susceptibility, or disturbing its peace.

From the first circulation of the false decreets down to the 15th c., no doubts were raised regarding them. Nicholas of Cusa and Cardinal Turrettini, who wrote works on the same subject, were the first to question their genuineness, but after the Reformation, the question was fully opened. The centuritaries of Magdeburg demonstrated their utterly apocryphal character. A reply was attempted by Father de la Torre; but the answer may be said to have been finally pronounced by Blondel.—See Milman's Latin Christiand, ii. 370—380; Walther's Kirchenrecht, p. 153; Gritzner's Kirchengeschichte.

ISINGLAS. See GELATINE.

ISIS, the name of an Egyptian deity, the sister and wife of Osiris, called by that people Hes, daughter of Set or Chronos, and Nu or Rea; according to another version, of Hermes and Rea, and called Persephone. She was born on the 36th day of the 4th month of the Egyptian, and was named Dox. Her death is represented as occurring in the 37th year of the 17th Egyptian month. After her death, her body was embalmed, and thrown into a coffin, and then thrown into the Egyptian year of 360 days. After the murder of Osiris by Typhon, and the throwing of him in a coffin into the Tanitic mouth of the Nile, his spirit cried to Isis, who, according to the Egyptian, life was given to the dead by the Paus and Satyrs, and went into mourning at Coptos; and hearing from some children where the chest had been thrown, proceeded to seek for it in company with Ambis, and discovered it enclosed in a tanairik column in the palace of Malcauter, at Byblos; and sitting down at a fountain in grief, was discovered by the ambrosial scent of her hair, and invited to the court by the Queen Astarte, to nurse her children. One of these she fed with her finger, and afterwards bore her finally immortalised by placing him in flames, while she herself, under the form of a swallow, flew round the column and bemoaned her fate. Having obtained the column, she took out the chest of Osiris, wrapped it in linen, and lamented so deeply, that the youngest of the queen's sons died of grief. She then set forth with the chest and eldest son to Egypt, and, at the river Pindar on her way, and the child killed this for substitution, and in the name of Menares, who had spied her secret grief in the desert. Having deposited the chest in a secret place, she proceeded to Buto to Horus; but Typhon discovered the chest, and divided the body into 28 or 26 portions, and scattered it over the country. These the goddess again sought, and found, except the phallus, which had been eaten by fish; and wherever she found any of the limbs, she set up a tablet, or sent an embalmed portion, deposited in a figure of the god, to the principal cities of Egypt, each of which subsequently claimed to be the true birthplace of Osiris. After the battle of Horus and Typhon, H. liberated Typhon, and had her son Pharaoh, and replaced by one in the shape of a cow. She was the mother of Haronis by Osiris before her birth, and of Harpocrates after the death of Osiris. She buried Osiris at Philae. The monarch Rhampsinutus played at dice with her and lost his head to Hades. In this way, H. flew into the star Sothis or Sirius. Her worship was universal throughout Egypt; she was particularly worshipped at Philae and at Babylon, where a special festival was held. Her tears were supposed to cause the inundation of the Nile. Another festival was celebrated to her at the harvest.

In the monuments, she is called the goddess-mother,
the mistress of heaven, sister and wife of Osiris, and nurse of Horus, the mourner of her brother, the eye of the sun, and regent of the gods. In her terres-
trtrial character, she wears upon her head the throne which represents her name, in her celestial, to the disc and horns, or tall plumes. She is often seen suckling Horus; sometimes she has the head of a cow, indicating her identity with the cow Athis, of whom the sun was born. Occasionally, she is identified with other female deities, such as Isis. On her head, she wears the vulture symbol of matern-ity. Her attributes were assumed by the queens of Egypt, and Cleopatra sat and gave the name in the character of the faithful Isi.

The worship of I. was introduced into Rome by Sulla (86 a. c.) from Tithorea, and shared the fate of that of other Egyptian deities, being associated with that of Serapis, Anubis, and others, and the temples from time to time destroyed. It flourished under the Flavians and Hadrian. At this time, I. was represented with a sistrum or rattle, a bucket, and a dress with a fringed border, knotted at the chest. On the Alexandrian coins, I. appears as Phoebus, bearing the Phoce, holding a full sail. The festivals, seclusion, rules of chastity, attracted many followers, but the worship was not altogether considered re-putable by the Romans. It was more extended and respected in Asia Minor and the provinces, but the Christians, who had a Christianized Isis (I. b.), I. was worshipped as the giver of dreams, and in the twofold character of restorer of health and inflictor of diseases.

The worship of I., as given by Plutarch, appears to be a fusion of Egyptian and Phoenician traditions, and the esoterical explanations offered by that writer and others shew the high antiquity and unintelli-
gibility of her name. She was thought to mean the same as the Egyptian Neith or Minerva, and Athis or Venus; to be the Greek Demeter or Ceres, Hecate, or even Io. Many monuments have been found of this goddess, and a temple at Pompeii, and a hymn in her honour at Antioch. The representations of her under the Roman empire are most numerous. I. having, in the pantethic spirit of the age, been compared with and figured as all the principal goddesses of the Ptolemy.—Plutarch, De Iside, Herod. ii. c. 59; Ov. Met. ix. 776; Hensen, Euchar. ikhili, ix. 85; Wilkinson, Sir G., Mann, and Caut., iii. 276, iv. 366; Birch, Gall. Ant. p. 31.

ISI. See THAMES.

ISKANDEROON, a small town and seaport of Asiatic Turkey, on the coast of Syria, is situated on a gulf of the same name, 60 miles west-north-west of Aleppo, of which it is the port. Its harbour is the best on the Syrian coast; but the town itself, though much improved within late years, is still poor and miserable. In 1856, 392 vessels of 133,114 tons, and the value of whose cargoes amounted to upwards of a million sterling, entered and cleared the port. Galls, silk, cotton, and fruits are exported; and the chief imports are rice, corn, salt, and goods of British manufacture. Pop. 1000.

ISLA DE PINOS, an almost circular island, of 800 square miles and 900 inhabitants, is the largest of the numerous satellites of Cuba, lying off the south coast of the Queen of the Antilles, pretty nearly on the meridian of the capital, Havana. It is celebrated for its excellent climate, exuberant fertility, rich mines, and valuable timber.

ISLAM, or ESLAM (Arab.), the proper name of the Mohammedan religion; designating complete and entire submission of body and soul to God, his will and his service, as well as to all those articles of faith, commands, and ordinances revealed to and ordained by Mohammed the prophet (see MOHAM-

MEDISM). Islam, it is held, was once the religion of all men; but whether wickedness and idolatry or political convenience led to its destruction cannot be determined. At the time of Noah, or only after Amur ibn Lobah, one of the first and greatest idolaters of Arabia, are most-points among Moslem (a word derived from Islâm), theogonists. Every child, it is believed, is born in Islam, or the true faith, and would con-
in the end were it not for the wicked-
ness of its parents, 'who misguide it early, and lead it astray to Magianism (see GREESES), Judaism, or Christianity.' See MOHAMMED, KORAN.

ISLAMABAD. See CHITTAGONG.

ISLAND (Ang.-Sax. island, 'properly, eye, land, a spot of land surrounded by water, as the
the face'—Wedgegood; Ice. ey, Dan. øe, meaning isle, and akin to eye; the ø in island crept into the influence of Fr. ile, derived from Lat. insula), in Geography, land surrounded with water. Native land is sometimes regarded as a continent, and sometimes as an island; so that the distinction of the terms is somewhat vague; even the great Eastern and Western continents are surrounded with water. In the ocean between New Holland and Asia, and to the eastern and islands are more numerous than anywhere else in the world. There, also, the largest islands are found. Excluding New Holland, the largest islands in the world are Borneo and Greenland; and these, New Guinea, Madagascar, Sumatra, and the Great Britain. Islands are found in groups, and when the number is great, the as-
semblage is called an archipelago. Some islands have the appearance of intimate geological connection with the continents near which they are situated, and some of such connection with each other that they seem as if they were the remaining parts of a former continent; others, generally of a more cir-
ular form, have their geological character more complete in itself. In the South Seas, there are two very distinct classes of islands, the one mountainous, and often with active volcanoes; the other low and flat, formed of coral. See CORAL ISLANDS.

ISLANDS OF THE BLESSED were, according to the old Greek myth, certain islands situated towards the edge of the Western Ocean, where the favourites of the gods, rescued from death, dwelt in joy, and possessed everything in abundance that could contribute to it.

ISLAY, an island on the west coast of Scotland, belonging to the group of the Inner Hebrides, and to the county of Argyle, lies west of the mainland of Kintyre, from which it is distant about 15 miles, and south-west of the island of Jura, from which it is separated by a strait called the Sound of Islay. Greatest length, 24 miles; greatest breadth, 17 miles; area, about 220 square miles; pop. (1861) 10,332. In the north, the island is hilly, and along the eastern shore runs a ridge rising from 800 to upwards of 1500 feet in height. The central and western districts are undulating or flat. Agriculture has of late years been greatly improved; the number of acres under culti-
vation is about 20,000, and abundant crops, both white and green, are produced. There are nine distilleries on the island, which produce about 400,000 gallons of whisky annually. Chief exports, black-cattle, sheep, and whisky. Lead and copper ores have been worked in mines in the interior, but have not yet been shipped to any considerable extent.

ISLINGTON, a suburb of London, but so closely
ISMAIL—ISOMORPHISM.

connected with it as to form part of it, is situated two miles north of St. Paul's. Pop. in 1841, 53,690; in 1851, 85,329; in 1861, 155,941. It is remarkable for the number of its religious, educational, and benevolent institutions.

ISMAIL, a town and river-port of Turkey, in the principality of Moldavia, on the north bank of the Kilia branch of the Danube, about 40 miles from the mouth of that river. It was taken, destroyed, and its garrison put to the sword by Suwaroff in 1792. The name has been into the possession of Russia after the peace of Bucharest in 1812; but reverted to Turkey by the treaty of Paris, 1856. It carries on an important trade in corn, as well as a considerable general trade. 370 vessels left the port with cargoes in 1855. Pop. (1856) 31,779. Previous to its reversion to Turkey, it was the station of the Russian fleet of the Danube.

ISMU'D, ISMID, or IZMID. See NICOMEDIA.

ISNI'K, or ISNECK. See NICAEA.

ISOBAROMETRIC LINES (Gr. iso, equal) are lines connecting together on a map those places which exhibit the same mean difference between the monthly extremes of the barometer. These oscillations are greater in some countries, as Hindustan and New Holland, than in others, as Western Europe and the Antilles.

ISOCHRONISM (Gr. iso, equal, chronos, time). A pendulum is isochronous when its vibrations are performed in equal times, whether these vibrations be large or small; but it can only possess this property by being constrained to move in a cycloidal arc. See CYCLOID. This is managed by causing the string to wrap and unwrap itself round two equal cycloidal cheeks, the diameter of whose generating circle is equal to half the length of the pendulum. Isochronism is closely approximated in practice by causing the pendulum to describe a very small circular arc.

ISOCRATES, a celebrated Grecian orator, was born at Athens, 436 B.C. He had a weak voice, and much natural timidity, which shut him out from a political career; but he taught rhetoric, and wrote orations for others, for which he received large sums; and though he did not mingle in the strife of parties, he was earnestly interested in the cause of his country's independence and honour. The fatal battle of Chaeronea broke his heart; he refused to taste food, and died after an abstinence of several days, 338 B.C. in the 98th year of his age.

I. I was a friend of Plato. His orations, of which upwards of twenty are extant, are characterised by extreme carefulness and elegance of style, but are not to be compared with those of Demosthenes in fervour, or with those of Lysias in natural beauty and simplicity. The best modern editions are those of Lange (Halle, 1803). Ad. Cornes (Paris, 1807). G. S. Dobson (Lond. 1828), and Bailler and Sauppe (Zurich, 1839).

ISOYNA'MIC, ISOCLINIC, and ISOYGONIC LINES (Gr. iso, equal, dynamis, force, kline, to bend, gonia, an angle), or lines of equal force, equal inclination, and equal declination, are three systems of lines, which being laid down on maps, represent the magnetic field of the globe as exhibited at the earth's surface in three classes of phenomena, the varying intensity of the force, the varying dip or inclination of the needle, and its varying declination from the true meridian. See MAGNETISM.

ISOLA BELLA. See BORROMEO ISLANDS.

ISOLA GROSSA, or LUNGA (Great or Long Island), one of the many islands which lie off the western coast of Dalmatia, in the Adriatic Sea, extends between 43° 51' and 44° 11' N. lat. Greatest length, 27 miles; greatest breadth, 3 miles; pop. 12,000.

ISOLA MADRÉ. See BORROMEO ISLANDS.

ISOM'ERISM (from the Greek word isomèrēs, composed of equal parts), a term applied to those organic compounds which are identical in their ultimate or percentage composition, but present different differences in their chemical reaction. Isomeric compounds, or isomers, are divisible into metamerie compounds, or metamerides, and polymeric compounds, or polymers.

In all metamerie compounds, the equivalent number of the equivalent compounds are simple multiples of the equivalent of the lowest number of the group. As an illustration of metamerides, propionic acid, (HOC,H,O,CO, and formic acid, (H,O,CO, exhibit the same composition. Their rational formula, which express their probable constitution, are perfectly distinct, yet it will be at once seen that they all have the same empirical formula (C,H,0,); and consequently the same percentage composition, and the same equivalent number, viz. 74.

As an illustration of polymers, the hydrocarbons homologous with olefin acid may be taken. Olefin acid is represented by the formula C,H,4, propylene by C,H,4, butylene by C,H,4, etc., and the like. These substances have the same percentage composition, but different equivalent numbers, except the forms being multiples of the more simple formula, C,H,4, which represents the composition of an alcohol-radical, methylene, which has not yet been isolated.

The carbo-hydrates, which are represented by the general formula, C,H,4,0, present well-marked examples of isomerism. Thus, cellulose (C,H,4,0,4), starch (C,H,4,0,6), and gum (C,H,4,0,11), are metamerie; whereas grape-sugar (C,H,4,0,8) possesses the same percentage composition, but twice as high an equivalent number, as hydrated acetic acid (C,H,4,0,2); and hence the three last-named substances are polymeric.

ISOMORPHISM (derived from the Greek words iso, equal, and morphe, form) strictly signifies similarity of form, but it is not restricted by the same to those substances which are not only similar in their crystalline form, but are also analogous in their chemical composition. The diamond (C), magnetic oxide of iron (FeO,Fe,O,), and alum (K,O,S0, - Al,O,SO, + 24aq.), all crystallise in octahedra, but there is obviously no analogy in the chemical composition of these substances; on the other hand, the spinel ruby (Mg,O,Al,O,), magnetic oxide of iron (Fe,F,0,), and chrome ore (Fe,O, Cr,O,), not only crystallise in octahedra, but (as in the formula shew) are also analogous in their chemical composition. Hence, the members of the latter group are truly isomorphous with the restricted sense, while the members of the former group present only one of the conditions of chemical isomorphism. In most cases, however, as Mitscherlich (to whom we owe most of our knowledge of this subject) has shewn, the chemical composition of substances that correspond in form is analogous; and that chemist has further endeavoured to prove that crystalline form is independent of the chemical nature of the atoms, and that it is determined solely by their grouping and relative position; and the same number of atoms combined in the same way
always producing, as he asserts, the same crystalline form.

Miller, in his Chemical Physics, gives fifteen

The discovery of the coincidence of similarity in crystalline form where the chemical composition is also similar, is the most important generalisation yet arrived at in the science of crystallography; and in chemistry it has been of essential service in facilitating the classification of compounds, and in determining the combining numbers or atomic weights of the elementary bodies.

ISOPODA—ISPAHAN.

The Isothermal Lines (Gr. θέρας, summer) are lines painted on maps to connect together places of the same summer temperature.

These lines are drawn on maps to connect together places of the same mean temperature.

—Isothermal Lines (Gr. θέρας, summer) are those which connect places of equal mean summer temperature, and the intersection of two isothermal lines gives the place of equal mean winter temperature.

Alexander von Humboldt was the first to lay down these systems of lines on maps in 1817. Their importance in reference to climate, meteorology, and the geographic distribution of plants and animals, can hardly be overestimated.

If the whole surface of the earth were uniform, it is evident that isothermal lines would precisely correspond with the degrees of latitude, and there would be no isothermal and isochronal lines, as distinguished from the isothermal; but neither would the earth be habitable for man, or suitable for almost any of the animal or vegetable tribes which actually exist upon it.

The Isothermal, isochronal, and isochronal lines are therefore of the greatest importance, as they show the ways of the currents, and the line of division of the sea and the land.

Isothermal lines are named according to the mean temperature which they indicate, the line of 50°, the line of 60°, &c. They are far from corresponding with parallels of latitude, or are parallel with one another, but are curved in such a manner as to indicate two northern and two southern poles or centres of greatest cold. It is in the extra-tropical parts of the northern hemisphere that these curvatures are greatest. The northern poles of cold are situated in the Arctic regions, one to the north of Siberia, nearly in the meridian of Jakutsk, and the other to the north of America, nearly in the meridian of the most western part of Hudson's Bay; and the isothermal lines through the greater part of the northern hemisphere descend to a lower latitude in the east of Asia and in the east of America than elsewhere, ascending, however, to a comparatively high latitude on the western coasts of both the greatest continents. Thus, the line of 50°, which passes through the north of England and the north of Ireland, and there reaches its most northern latitude, descends below the latitude of New York, on the eastern coast of America. The distances of the isothermal lines are also remarkably various in different parts of the world. Thus, in the east of North America, from Charleston to Labrador, the mean annual temperature varies more than a degree and a half for every degree of latitude; whilst in Central Europe the variation is only about one-tenth of a degree, and on the western coasts of Europe still less.

Another interesting system of lines relative to temperature has been laid down by Mr. Dove, which he calls Isochronal Lines—the former being objectionable, as formed from words of two languages—lines connecting places which have the same excess above or below the normal mean temperature of their latitude. See CLIMATE, METEOROLOGY, AND PHYSICAL GEOGRAPHY.

ISPAHÁN, properly ISPAHAN, a famous city of Persia, capital of the province of Irak-Ajam, and formerly capital of the entire country, is situated on the Zenderud, in an extensive and fertile plain, 226 miles south of Tehran; lat. 32° 46' N., long. 51° 43' E. The Zenderud is here 600 feet deep, and is crossed by three noble bridges, one of 1000 feet in length, and having 34 arches. Groves, orchards, avenues, and cultivated fields surround the city for miles; but the permanent beauty of the scenery is only served to make the contrast all the more striking between the former splendour of the city and its present ruinous condition. Miles of street are now almost tenanted, and many of the palaces deserted, and rapidly falling to decay. In the vicinity of the city, a double range of columns, each rising from the backs of four lions in white marble. The pillars are inlaid with mirrors, and the walls and roof are profusely decorated with glass and gilding. The suburb Julla, on the southern bank of the river, once a flourishing Armenian settlement of 30,000 inhabitants, is now little better than a mass of ruins. L., however, is still an important city, and the seat of extensive manufactures, including all sorts of woven fabrics, from rich gold brocades and coloured silks, to the coarsest cottons. Textiles and ornamental goods in great variety, with fine arms, sword-blades, glass, and earthenware, are also manufactured. Many of its bazaars are still frequented daily, and its merchants are still influential enough to make the prices in L. lower than in India. Of late years, L. has shown considerable signs of improvement; many of its edifices have been rebuilt; see, as important article of commerce, is now largely cultivated in the neighboring country. Pop. estimated at from 160,000 to 200,000.

L. was a trading town of importance, and the
capital of Irak, under the califs of Baghdad. It was taken by Timur in 1387, when 70,000 of the inhabitants are said to have been massacred. During the 17th c., under Shah Abbas the Great, it became the capital of Persia, and reached the climax of its prosperity. Its walls were then 24 miles in circuit, and it is said to have had between 600,000 and 1,000,000 inhabitants. It was then the emporium of the Asiatic world; the merchandise of all nations enriched its bazaars, and ambassadors from Europe and the East crowded its court. In 1722, it was devastated by the Afghans, and some time afterwards the seat of government was transferred to Tehran (q. v.).

ISRAEL, KINGDOM OF. See JEW.

ISSOIRE (anc. Issoludum), a town of France, in the department of Puy-de-Dôme, at the confluence of the Couse and Allier, 20 miles south-east of Clermont. Pop. 6000.

ISSOUDUN, a manufacturing town of France, in the department of Indre, is situated on the river Théoule, on the railway from Orleans to Limoges, 15 miles north-east of Châlonsau. The principal manufactures are woollen cloth and yarn. Pop. 12,234.

ISSUE, in Law, means the point of fact in dispute which is submitted to a jury.

ISSUS, anciently, a seaport on a gulf of the same name in Cilicia, Asia Minor, celebrated for a victory which Alexander the Great obtained here over Darius (333 B.C.), by which the camp and family of Darius fell into his hands. Its exact site has not been ascertained.

ISTALIF, a town of Afghanistan, situated 22 miles north-north-west of Cabil, on a tributary of the Kabul river. In 1842, it was partially destroyed by the British. Previous to that event, it had 15,000 inhabitants, who were employed chiefly in spinning, weaving, and dyeing cotton.

ISTHMUS (Gr.), in Geography, a narrow neck of land joining two portions of land. The name isthmus was by the ancients often employed without any addition to designate the Isthmus of Corinth, joining the Peloponnese to continental Hellas. Here there was a famous temple of Neptune, and here also we celebrate the Isthmian Games (one of the four great national festivals of Greece), at first every third year, and afterwards every fifth year. They were said to have been originally instituted by Sisyphus, and afterwards restored by Theseus. The games, like those of Olympia, consisted of athletic exercises, with the addition of competitions in music and poetry. The victors were crowned with garlands of fir, and their statues were placed in the temple of Neptune. Down to the destruction of Corinth by the Roman general Mummius (146 B.C.), the management of these games was in the hands of the rulers of that city, though the Athenians always enjoyed the seats of honour. The Romans added the coercer and more brutal amusements of gladiatorial exhibitions and fights with wild beasts. The spread of Christianity was fatal to their popularity, but we still read of them in the reigns of Constantine and Julian.

ISTRIA, an Austrian maritavicate, which, with the county of Görz and Gradiska, and the town and territory of Trieste, forms the Austrian crownland of the coast-districts or Küstenland. It consists of a peninsula projecting into the north-east corner of the Adriatic Sea, together with the adjacent Quarner Islands.

IZVORNIK. See ZVORNIK.

ÍSWARA (from the Sanscrit iswara, to possess power, hence literally, lord) is an epithet applied to different Hindu divinities, but in mythological acceptance mostly designates ŚIVA (q. v.).

ITALIAN ARCHITECTURE. This term is usually limited to the style practised by the Italian architects of the 16th, 17th, and 18th centuries, and which has since been adopted in every country in Europe. This style originated in a revival of the ancient architecture of Rome. Although Gothic architecture had been practised in Italy during the 16th and 17th centuries, it had never been thoroughly naturalised. The Italians always shewed a preference for the round arch over the pointed northern form; and even in the buildings they erected in the pointed style, there is a certain simplicity and largeness of parts indicative of a classic feeling. As early as 1350, Giovanni Pisano, in the beautiful sculpture of the pulpit at Pisa, shewed a return to the ancient models. Arnolfo di Lapo built the cathedral of Florence (1290—1300), and in his design, proposed a great dome (a remarkably Roman feature) over the crossing of the nave and transept. This he did not live to complete; but he prepared the way for Brunelleschi, the chief aim of whose life was the accomplishment of the great dome of the cathedral. He went to Rome to study the ancient buildings there, at that time neglected and hardly known to the Italians themselves. After devoting a considerable time to exploring these monuments, he returned to Florence; and, after great opposition, succeeded in carrying out the construction of the dome as it now stands. From this time, the revival of Roman architecture went on rapidly. It was encouraged by the popes and other...
ITALIC VERSION—ITALY.

princes of Italy; and the invention of the printing-press soon spread a knowledge of the works of the Italian architects over Europe. At first, the Roman monuments and ornaments only were copied and applied to the existing forms. As the ancient style became better understood, its general principles were gradually adopted, until at length the Modern Italian style was formed. This style may be regarded as an ancient Roman architecture applied to the forms and requirements of modern buildings. It has been admirably applied to domestic, but it has never been so successfully used in ecclesiastical, edifices. The domes of the Italian churches render the interiors of these buildings very impressive, and are a feature, for the introduction of which into the west of Europe, we are indebted to this style; but the façades of the churches are broken up into stories, and want the unity of a Gothic front.

Italian architecture is divided into three styles or schools, according to the places where it was practised—viz, the Florentine, Roman, and Venetian. The Florentine buildings are massive and grand in effect; they are indebted to ancient Roman art chiefly for details, the outlines being the same as those of the older buildings, formed to suit the requirements of the place. Florence being a turbulent city, every man who had anything to lose had litigated for years to get his house his case. Accordingly, the basement floor is massively built with large blocks of stone, and the windows are small and plain. The Roman school naturally resembles more closely the ancient Roman buildings so numerous in this city—pilasters, brackets, &c., being freely used. In Rome, the plan of including two or more stories in one order of columns or pilasters with their entablature, with an attic or low story above, first originated, and was afterward extensively, but as already explained, not successfully applied to churches. The Venetian style is, as might be expected in a city long accustomed to elegant palaces, the most ornate and picturesque of the Italian schools. Venice is crowded with specimens of all kinds from the earliest to the latest renaissance, and retains its individuality of style from first to last. Each story is marked by a separate tier of columns or pilasters with their entablature; the windows are arched and ornamented with columns, and the spandrils commonly filled with figures. The outline is varied in form, and is usually finished with a balustrade, broken by pedestals, and crowned with sculptured figures. It is from this most picturesque of the styles of the Italian renaissance that the other countries of Europe derived their peculiar forms. See RENAISSANCE, ELIZABETHAN, CINQUECENTO.

ITALIC VERSION (Vetus Itala), the name given to a translation of the Scriptures into Latin, which preceded the Vulgate. Its origin is commonly supposed to date from the middle of the 2d century. The Italic Version was in general use down to the time of Jerome, who, being dissatisfied with the imperfections which it exhibited, undertook to revise and amend it, but ultimately produced the new translation known as the Vulgate (q.v.). The Italic Version of the Old Testament was made, not from the Hebrew, but from the Septuagint.

ITALY. The geographical territory comprised under the name of L consists of a considerable stretch of peninsular mainland, closely resembling a boot in shape, besides several islands, situated in Southern Europe, between lat. 36° 35' and 47° N., and between long. 6° 25' and 35° E. From the southern extremity of Sicily to the Alps its maximum length is about 600 miles, its utmost breadth being 300 miles.

Boundaries.—Its boundaries on the N. are France and Austria, on the S. the Mediterranean, on the W. the France and the Mediterranean, and on the E. the Ionian and Adriatic Seas, while its natural limits are strongly defined by the Alps and the seas.

Area.—The entire superficial area of L Proper and her insular dependencies comprises 117,914 square miles. The total pop. (1863) is 23,925,717.

Divisions.—By the recent political distribution of L, important modifications have been effected in her territorial divisions, which are now reduced to the following five:

1. The Kingdom of Italy.
2. The Roman or Papal possess—
3. Venetia.
4. The Republic of San Marino.
5. The town of Monaco.

The Kingdom of Italy, which embraces a total area of 98,160 geographical square miles, and a population of 22,000,000, owes its present extensive limits to the voluntary annexation of several states to the Sardinian monarchy, the whole being now governed by a constitutional sovereign of the House of Savoy, Victor Emmanuel. It is composed of the following administrative divisions:

1. The Former Kingdom of Sardinia (exclusive of the provinces of Savoy and Nice) and Lombardy, divided into the following provinces:

Arezzo, Florence, Grosseto, Livorno, Lucca, Pisic...
ITALY.

Plains.—The great plains of L. are those of Lombardy, which stretches from the Mincio to the Ticino and the Po; of Piedmont; the Venetian plains; the plain of the Roman legations; the plain of the Campo Felice, on which stands Vesuvius, the Aplian plain; the long, narrow Neapolitan plain of the basilicata, 100 miles in length and 24 miles in breadth, stretching along the Gulf of Taranto.

Rivers.—The great majority of the rivers of L. are only navigable for small coasting boats in summer. By far the most important is the Po (q.v.), which rises on the border of France, and flows into the Adriatic. It has numerous tributaries. Among the others may be mentioned the Adige, Brenta, Piave, Tagliamento, Aterno, Sangro, Metauro, Ofanto, Bradano, also belonging to the Adriatic basin; the Arno, the Tiber, the Umbrone, the Garigliano, and the Volturino, which belong to the Mediterranean basin. The classical and historical associations of many of the Italian streams, even when mere rivulets, invest them with perennial interest.

Canal System.—The canal system of L. is most extensive in the north. Nine principal canals in Lombardy administer to the irrigation of the plains and to the judicial and commercial communication of the provinces, contributing in no small degree to the prosperity of the district. The Naviglio Grande or Ticinello is the finest hydraulic construction in L.; it communi- cates between the Ticino and Milan, and has a course of 28 miles navigable for vessels of large size. It was begun in 1179. The Naviglio Marscato, 38 miles long, unites Concesa on the Adda with Milan; the Naviglio di Parva is 18 miles in length; the bifurcated Naviglio d'Oglio unites the Po with the Adige. 233 canals intersect Piedmont, extending over a length of 1932 kilometres. Venice comprises 203 navigable, and 40 minor canals. Numerous canals have been constructed for the drainage of the Pontine Marshes. This system of water-communication was early carried to a high degree of efficiency in L., and is of inestimable service in the agricultural districts.

Lakes.—The mountain lakes of L. are famed for their picturesque beauty. They are mostly in the northern provinces of Lombardy and Venetia. The principal are Maggiore, Lugano, Como, Iseo, and Garda. The Roman lakes of Perugia, Bolsena, and Trasiemene, the Ticino, Lugano, Iseo, Maggiore, and Colano in Naples, also deserve mention.

Springs.—The mineral and thermal springs of L. are innumerable, and possess a great variety of curative and sanitary properties.

Climate.—In the northern provinces, the climate is temperate, salubrious, and frequently severe in winter; in the centre, it assumes a more genial and sunny character; while the heat of the southern extremity is almost of a tropical intensity. The singular clearness of the atmosphere sets off the landscape and monumental beauties of L. with brilliant effect. The drawbacks of L.'s climate are the piercing tramontana or mountain winds; the deadly malaria...
ITALY.

hemp, flax, cotton, which are largely grown, and even the sugar-cane is successfully cultivated in the Two Sicilies. Agriculture, however, except in the north, is in a very backward condition. Nevertheless, the annual yield of cereal crops is considerable, and not only suffices for home consumption, but likewise for foreign export. The northern provinces or great plains, Tuscany, and the islands of Sardinia and Sicily, furnish most of the grain of Italy; is grown extensively in Sicily, and yields annually about 2,000,000 lbs., which is manufactured in the native looms of Tuscany, Piedmont, Lombardy, and Rome. The fruits of the Two Sicilies are exquisite in flavour, and embrace several tropical species. Oranges, lemons, almonds, figs, dates, melons, and the pistachio-nut are common to all orchards, and are largely exported. A considerable cheese-trade exists in the northern provinces, that of Lombardy alone yielding a revenue of more than £2,000,000. I. also furnishes various valuable substances, such as sulphur, alum, &c. All the domestic animals of Western Europe are to be found in I., besides buffaloes and camels, which are not uncommon. The fauna of I. includes most of the British species, besides the wolf, lynx, boar, marmot, vulture, ibis, flamingo, and pelican. On the coast of the southern provinces are to be found many species of African water-fowl. The ostrich and baboon are small birds, much esteemed for their flavour. The nocturnal fireflies are a remarkable feature of insect life.

Fisheries.—The sea and fresh-water fisheries of I. are considerable; the Mediterranean furnishing immense quantities of tunny, anchovies, sardines, mullet, pilchards, and mackerel. The export of anchovies and sardines is of vast extent. The river-fisheries yield salmon, trout, sturgeon, lampreys, tench, and barbel, &c.; and the lagoons contain excellently flavoured oysters. See COMMERCIO. The crustaceans and shell-fish of the Italian seas are of great variety and delicate flavour, and are a favourite article of Italian consumption.

Exports.—Among the exports of I. may be noted raw silk, rice, fish, fruits of various kinds, marble, alabaster, sulphur, alum, silks, velvets, cloth of gold and silver, perfumes, mosaics in stone and wood, carvings in wood, macaroni and similar culinary pastes, porcelain, majolica, preserved fruits, and metals, instruments, jewellery, and objects of art.

Army and Navy.—The latest statistics of the military and naval force of the kingdom of I. give the following numbers: In 1861, the army comprised a total of 225,600 men, of whom 11,401 were officers. The army was then constituted as follows: staff, 210; grenadiers, 13,484; infantry, 125,556; bersaglieri, or sharpshooters, 19,121; cavalry, 15,226; artillery, 18,000; engineers, 3,778; carabineers, 18,500; commissariat officials, 2,753; military train, 2,669. By the late incorporation of the volunteer forces the army has been considerably reinforced. In Mar 1862 the military establishments consisted of vessels, sailing and steam, carrying 1085 guns, with a force of 10,227 men; there are also 5880 marines.

Finance.—The budget of the kingdom of I. for 1862 gave the income at nearly £26,000,000, and the expenditure upwards of £40,000,000; the public debt, 1st January 1862, amounted to nearly £120,000,000.

Religion.—The dominant form of religion of I. is the Catholic, predominating over the Protestants in a most decided manner; the Church of Rome being not only the only, but the only tolerantly tolerated form of religious belief. The Roman Catholic clergy are estimated at about 500,000, including the monastic fraternities. The 4800 churches and 2700 parishes of I. have of late suffered considerable diminution, owing to the suppression of several orders, and the enforced sale of their lands by the enactment of the Piedmontese government.

Education.—The mass of the Italian people are incomparably illiterate; the primary elements of education, reading and writing, are by no means universal even among the better classes. A great educational impulse, however, has been imparted to all the recently united states. The state, parochial, and endowed schools are daily being inaugurated. Normal schools, on the British principle, have been already founded for the training of I.'s future teachers; and the judgment, tolerance, and discrimination displayed in the various appointments to these institutions, give the happiest promise for the future education of Italy. The universities of I. are numerous, many of them being of ancient date and European fame. The chief are those of Salerno, Bologna, Naples, Padua, and Florence. The universities of Pavia, Turin, Parma, Florence, Catania, Cagliari (in 1764), Genoa (remodelled and extended, 1783), Modena (recently reopened). See VETEINIA, FATAL STATES, MONACO, MARINO.

History.—The ancient history of I. will be more conveniently treated of under ROM E; see also ETRURIA, UMBRIA, &c. We proceed to the dawn of modern history. The Western Roman Empire fell before a mixed horde of barbarous mercenaries chased by the Goths and Huns under their leader, Odovacer, king of Italy (476). After 13 years of military despotism, he was slain, and his followers vanquished by the Ostrogoths, led by their great king, Theodoric. The Ostrogoths (see GOTTI), that is, a branch of the Huns, then rose to the situation of one of the most powerful nations, and invaded Italy (568); and under their rule the ancient political system of Northern Italy was superseded by the introduction of feudal and Teutonic institutions. The Lombards, in their turn, were conquered...
ITALY.

by Pepin (754) and Charlemagne (774), the latter of whom was crowned emperor of Italy. The Lombards, however, retained the great dukies of Benevento, Spoleto, &c., till the advent of the Normans. In 842, the Saracens invaded I., and took possession of many important places on the southern coast, which they held till 1016, when they were driven out by the Normans. On the fall of the Carolingian dynasty (888), the crown of Italy fell to Berengarius I., chief of the Friuli, whose descendant, Berengarius II., did homage to Louis the Stammerer (951); and in 961, Otto deposed his vassal, and assumed sovereign rights over the Italian kingdom. From this period, the chief towns of Italy rapidly emerged from their previous insignificance. A foremost object of Otto and his successors was the abatement of the papacy; and for a time these emperors successfully arrogated to themselves the right of nominating to the chair of St. Peter. The free cities, or republics, were well satisfied with the Carolingian dynasty, and the accession of Conrad was the signal for various tumultuous risings of the Italians against their German rulers, who had grown the object of general detestation. Important feudal modifications developed themselves. The province of Milan, the kingdom of Provence, grew into great feudal lords, and to exalt the inferior vassals and citizens. Under the reign of his successor, Henry III., we find the spirit of association, alike for offence or defence, waxing strong in Italy. The great oligarchies of the great Guelfic House of Este (q. v.), the bloody wars of the Investiture (q. v.), and the establishment of an aneuristic form of municipal government (1100), are the three most notable events that occurred under the Francescan dynasty.

Under the Hohenstanen dynasty, Italy enjoyed an interregnum from foreign rule of about 60 years, which, however, was wasted in suicidal conflicts between the two factions of the Guelfs and Ghibellines. The free cities, or republics, of Italy rivalled kingdoms in the extent and importance of their commerce and manufactures, the ad
cancement of art and science, the magnificence of their public edifices and monuments, and the prodigious individual and national wealth to which they attained. Unhappily, a spirit of rivalry and intolerance grew up during this period of medieval splendour, and in the arbitrary attempt of these states to secure supremacy over each other, they gradually worked their own destruction.

From the Sicilian Vespers (1282) to the reign of Henry VII. (1308), the chief historical incidents are the war between Genoa and Pisa, ending in the abatement and ultimate decline of the latter (1284); the quarrels of the Guelfic factions, the Sienesi and the Nerli, in Tuscany; the papal efforts for their reconciliation (1301); the residence of the popes at Avignon (1304–1377); and the rise into importance of the oligarchic republic of Venice (1311). During the first half of the 14th c., the German emperors made several fruitless attempts to regain political supremacy in I.; but in 1355, the Emperor Charles IV. gave up the struggle.

The overthrow of several petty tyrants, of which the foremost were the Visconti or lords of Milan, replaced that of the emperors. From the middle of the 14th c. to the end of the 15th, the collective history of I. ceases, each city being ruled by some powerful local family—as, for example, Verona by the Della Scala, Padua by the Carrara, Ferrara by the Este families, and Mantua by the illustrious princes of Gonzaga; Milan by the Della Torre, Visconti, and Sforza families. See also GENOA, PISA, FLORENCE, VENICE, NAPLES, &c.

From 1495 to 1525, I. was the theatre of the sanguinary struggles between France, the native rulers, and the Hapsburgs, but the battle of Pavia (1525) thoroughly established the ascendancy of the German emperor, who appointed over the various states rulers of his own selection. During the 17th c., no events of note mark the history of I.; the country being at peace, the various states pursued certain traditional bounds to their decreased limits permitted. In the following century, some territorial changes were effected during the war of the Spanish Succession. In 1793, I. partially entered the European coalition formed for the defence of France, whose arms, however, proved irresistible. By the treaty of Campo Formano, 17th October 1797, the entire state of Venice was transferred to Austria, while the rest of the country, under various designations, became for some time a part of the dependencies of France. In this anomalous condition it remained during the rule of Napoleon. After the battle of Waterloo, the final reconstitution of I. was decreed as follows by the congress of Vienna: the kingdom of the Two Sicilies was ceded to the House of Savoy, to which were added all the provinces of the Genoese republic; the Lombardo-Venetian kingdom fell to Austria; the principalities of Modena, Reggio, and Mirandola, to which were soon annexed Mantua and Carrara, remained in the possession of the family of Este; Lucca was created a duchy, for the rightful Duke of Parma, whose hereditary state was con
ceded to Maria Louisa, ex-empress of the French; the duchy of Tuscany was restored to the Austro-Lorraine dynasty; the Papal States, which had been reduced to the kingdom of Naples to the Bourbon; while the petty state of San Marino was allowed to retain its republican form; and Monaco remained an independent principality under the Prince of Valentinois.

By the congress of Vienna, I. was again cast at the feet of the papacy and of Austria, and this at a period when progressive aspirations were strongly reawakened in the Italian people. The system of resolute oppression adopted by the restored rulers speedily produced an irreconcilable hostility between themselves and their subjects, and a network of secret societies for the organisation of national resistance spread throughout the entire peninsula. The first-fruits of their organisation were the risings of 1820 and 1821 in Piedmont and Naples, to demand constitutional rights. Austrian intervention quelled both these movements; and in 1831, when a similar rising occurred in Modena and the Roman States, it was subdued with sanguinary ferocity by an Austrian army. In these movements, no distinct tendency towards national unity is perceptible; and only on the accession of Charles Albert to the throne of Piedmont (1831) was this grand idea of modern I. propounded by Joseph Mazzini, in an address to the king, urging him to assume the role of liberator and leader of Italy. The king of Pied
tmont, by yielding in some degree to the spirit of his time, prepared for Piedmont the pre-eminence she now enjoys throughout the country. The accession of Pius IX. in 1846, seemed the inauguration of a new era for I.: a general amnesty was followed by wise, liberal measures, which were also adopted by the Papal States, the population of which was the same as that of the other states resolutely refused every measure of reform, and by a simultaneous outbreak in Sicily and Milan in January, the great revolution of 1848 was inaugurated in Italy. The revolution of France in February imparted a strong impulse to that of I., and speedily Naples, Piedmont, and Rome con
ceded constitutional rights to the popular demands. The Milanese unanimously revolted against Austria.
rule on the 17th of March, and after five days of heroic fighting, the Austrians were expelled from the city, and Radetzky, with 70,000 troops, compelled to retreat from its walls. On the 29th, Charles Albert entered Lombardy, the avowed champion of Italian independence, and the leader of the national struggle. All the sovereigns of L contributed their best troops for the war, and on the Roman volunteers setting out for Lombardy, the pope himself in public pronounced a solemn benediction on their banners.

But ere a month had elapsed, Pius IX. suddenly halted in his career of liberator of Italy, and abandoning the national cause, launched (19th April) a successful counter-revolutionary campaign against two revolutions against Naples and Rome. In the Congress of Paris, at the close of the Russian war (1856), Cavour (q. v.) forcibly exposed the unavoidable dangers of a continuance of Austrian and papal misrule. He strongly urged the expediency of a withdrawal of French and Austrian troops from Rome and the legations. In the beginning of 1859, Victor Emmanuel proclaimed from the Sardinian parliament his intention of actively aiding in the deliverance of the oppressed Italian population from the yoke of Austria. Towards the end of the year, Sardinia and France jointly prepared for war with Austria, and in April 1859 the war commenced. The victories of Magenta and Solferino were quickly followed by the abrupt and inconclusive peace of Villafranca, 11th July 1859, by which a confederation of the Italian states with the papal protectorate was proposed as the best solution of L. difficulties. The whole of L. energetically rejected the scheme; and early in 1860, the various states whose sovereigns were in flight from the Lombard campaign voluntarily declared in favour of annexation to the kingdom of Piedmont. On the 15th of March, Parma, Modena, and the Eblitian provinces were incorporated with Sardinia; and the grand duchy of Tuscany on the 22d. On the 17th March, the law by which Victor Emmanuel assumed the title of King of Italy was promulgated amidst universal rejoicings. On the 24th March, the provinces of Novara, Alessandria, and Genoa passed to Austria. On the 6th of the ensuing May, Garibaldi, with about a thousand volunteers, set sail from Genoa for Sicily, where a revolutionary outbreak had taken place. His swift and comparatively bloodless conquest of the Two Sicilies is one of the most extraordinary incidents in modern history. Meanwhile, the Sardinian generals Cialdini and Farini having advanced into the papal provinces, the papal forces under Lamoriciere were routed at Castelfidardo, which was followed by the capture of 4,000 prisoners at Loreto, and the surrender of Lamoriciere at Ancona. Hence the Sardinian forces marched into the Abruzzi, while Victor Emmanuel proceeded in person to Naples. On November 7th, at Tarino, Garibaldi unconditionally relinquished to his sovereign the southern provinces liberated by his genius and valour. Umbria and the march of Ancona were incorporated with the kingdom of L. The kingdom of L. has been formed by the union of all the great European powers with the exception of Austria. On the death of Cavour, June 1861, the ministry of Baron Ricasoli was formed, but after which Garibaldi offended once more, that of Rattazzi, 31st March (1862), whose avowed subserviency to the French empire created considerable alarm amongst the liberals of Italy. One of its earliest acts was the incorporation of the southern volunteer forces with the regular army of the 11th and 10th, a great aggregate meeting of deputies from all the liberal clubs of the kingdom was held under Garibaldi's presidency; and on the 20th, having previously been entertained at a grand banquet by the royal family, the great army set out on a tour throughout L. with the view of organising clubs amidst the youth of all the chief cities. An apprehension on the part of the government that Garibaldi contemplated an armed expedition in aid of France, led to special measures of repression. Ministerial orders were next transmitted to Garibaldi, prohibiting any further organisation of the rifle societies. On the 20th of June, Garibaldi appeared in Turin, and on the 29th landed at Palermo, in Sicily, where he was received with enthusiasm by Prince Humbert, the heir-apparent of the Italian crown. On the 4th of July, the ministry was seriously disturbed by the warmest manifestations of sympathy for Garibaldi, who, under the impression that he possessed the covert approbation of the sovereign, proclaimed himself victor in his last triumph at Rome, but expressed his unshaken sentiments of loyalty to the king. On the 23d August, Sicily was declared in a state of siege, the liberal clubs were dissolved, and an armed force despatched to pursue and disperse the volunteers. Garibaldi reached the 18th Catania, and some days later succeeded in effecting a landing on the coast of Calabria with the greater part of his followers. General Cialdini having been appointed commissioner extraordinary in the island of Sicily, with full powers over the civil and military authorities, proceeded to the most stringent measures to effect the capture of Garibaldi. The affair of Aspromonte, in which Garibaldi's small force of volunteers were compelled to surrender, their heroic leader ordering them not to fire on the royal troops, put an end to the semblance of revolution. The wounded chief was conveyed as a prisoner to the fortress of Varignano, at Spezzia. This was the signal for a general declaration of war. Garibaldi had been conducted to the French coast, and the Italian monarch enabled him to proceed to Paris, from whence he has recently returned to his island-home of Caprera. On the meeting of the houses of parliament, the minister of Rattazzi had to sustain a formidable attack from the liberal members, who demanded the impeachment of the premier and his colleagues. Rattazzi, finding himself unsupported by any sect
of the house, after an unavailing defence, resigned his portfolio on the 10th of December, and was succeeded in office by Signor Farmi (q. v.). Authors consulted: Sismondi, Repubblica di Italia; Macchiavelli, Istorie Fiorentine; Guicciardini, Storia d' Italia; Denina, Rivoluzioni d' Italia; Bottai, Storia d' Italia; Balbo: &c.

Italian Language and Literature.—The Italian language is descended from the Latin, and there have been no less than three great poets, each of whom the transition took place. In the view, however, of the scientific students of language, there is nothing special in the case; the changes are sufficiently accounted for by that tendency to phonetic decay common to all languages, and the usual work in a living tongue, and which is especially active in a chaotic and transition state of society like that of L. at the downfall of the Roman empire. In the Sicilian dialect, this tendency had become predominant, and being released from the fixing influence of a written literature, depart more and more from the grammatical standard; and in the case of L., the barbarian intruders would, to a still greater extent, have divested the language of what is called, in modern times, the "Latin idiom." Itturie late wonderfuIly the spring from compositions each of their own navations, and some of them have been even divested of themselves, till it became a vehicle of a new and polished, and elegant diction; and the modern works of Dante, the Poeti Antichi by Alacci (1661), and the modern work of Rannucci, Manuie de la Letteratura del Primo Secolo (Florence, 1837, 3 vols.). Brunetto Latini (1250), the preceptor of Dante, was reputed a man of great sense and sagacity, and his work, the Idoro, is a marvel of heterogeneous knowledge. Il Teorettio is a curious compendium of moral precepts, and Il Patafio is still more curious production, the obscene levity of which earned him a place in the Inferno of his pupil. Guido Cavalcanti, the cherished friend of Dante, was more of a philosopher than a poet. Italian also began to be now adopted as the vehicle of learned and scientific prose. The historical chronicles of Matteo d'Anjou, a Neapolitan, are the oldest specimen of Italian prose literature (1247—1268); but the Florentine Maleaspini (died about 1280) is the first historical writer whose style is elevated and polished. In short, contemporary with the appearance of Dante, the Italian dialect was rapidly superseding Latin in grave prose composition, as well as in poetry, and soon became the recognised oral and written polite language of the entire country, while various local dialects were preserved in use among the abler classes of the people. It has been finely observed that Dante found the Italian language in its cradle, and exalted it to a throne; the Divina Commedia imprinted on the Italian tongue a grave and majestic character, which it had hitherto never had a chance to rank with the languages of Greece and Rome. The impetus imparted by Dante to the language and intellectual life of his country, has continued to the present day.

The minor poets, Francesco Stabile, or Cecco d'Ascoli, burned by the church (1227), and author of L'Acror, a critical attack upon Dante, and a wonderful mixture of learning, acuteness, and superstition; Francesco da Barserino (1284—1313), and Cino da Pistoja, the learned jurist and poet, whose work on jurisprudence, Il Comento sul Codice, and pleasing amatory verses, won for him the commendations both of Dante and Petrarch (1270—1374), claim mention before the great name of Francesco Petrarca (q. v.) (1304—1374), the creator of Italian lyrical poetry, and the enriecher and perfecter of its language. The illustre of Petrarca's fame, however, is not derived from his sonnets alone. Apart from their exquisite beauty and pathos, their classical elegance and simplicity of diction render them an abiding standard of Italian poetry. Italian, which, in its poetical capacities, we have seen created by Dante, and refined by Petrarch, was first moulded into a perfect form of prose by the prince of novelists, Boccaccio (q. v.). The Decameron is a series of tales, and Boccaccio's best known work. Boccaccio's style is deeply tinged by his culture of classical literature; and in his straining after the pompous majesty of Latin construction, he frequently exceeds the structural capabilities of his own language, which is naturally direct and simple in the order of Chaucer and Alexander. His works include, La Gondola, Il Novizi, La Costa, the Romance of Florenc, and Ser Giovanni Fiorentino (1348), also composed tales distinguished by the excellence of the language; while Dino Compagni and Giovanni Villani enrich with their historical literature of L. with excellent chronicles, written in a spirit of fairness and with great beauty of style.

The 14th c. was lavishly productive of great original literary creations, the writers of that age, or i Trecentisti, according to their Tuscan appellation, 267.
being as distinguished for the sublime originality of their genius as those of the 15th c. were famed for their abstract erudition and philosophy. Italian was the chosen language of the Trecentisti, and in their writings attained a high degree of refinement and purity. On the other hand, the scholastic writers of the 15th c. almost entirely excluded Italian from their works, substituting for the language of Dante and Petrarch a faulty form of Latin. To this period, probably on account of the influence of the Roman Catholic Church, which was at a low ebb, a distinctly religious form of literature as illustrated by the Physiologus, may be assigned.

The 16th c. is confessedly the Augustan age of Italian letters, art, and science. In a galaxy of splendid names, the foremost are those of Ariosto (q.v.), Tasso (q.v.), Machiavelli (q.v.), Guicciardini (q.v.), Raphael (q.v.), Michael Angelo (q.v.), Fallado, and Vignola. Pope Leo X. and his successors vied with the other sovereigns of Italy in the cultivation of literature, and the most illustrious man who, under the title of Quincentist, are considered models of pure and noble Italian composition, is Orlando Furioso of Ariosto, held to be the first genuine epic of chivalry and romance, which is already a classic, and a model for the highest.[24] No criticism of the 17th, 18th, or 19th centuries could have made any improvement upon this work.

The 17th c., though not marked by much creative genius in literature, unquestionably exercised an immense influence on the Italian mind. The revival of letters, the invention of printing, the discovery of a new world, and the opening up of a maritime channel to the wealth and traffic of the Indies, co-operated, one may say, in producing that wonderful development of art and enterprise which the succeeding age exhibited; while the advancement of learning and science, and the systematisation of the sciences by the founding of numerous universities and literary institutions, the aim of these latter being the diffusion of general knowledge and sound practical science. Many of the magnificent typographical tracts which the great public libraries of Italy abound, belong to this golden age, and are due to the artistic taste of Aldo Manuzio. See ALDINE EDITIONS.

The 16th c. is confessedly the Augustan age of Italian letters, art, and science. The 17th c., though not marked by much creative genius in literature, unquestionably exercised an immense influence on the Italian mind. The revival of letters, the invention of printing, the discovery of a new world, and the opening up of a maritime channel to the wealth and traffic of the Indies, co-operated, one may say, in producing that wonderful development of art and enterprise which the succeeding age exhibited; while the advancement of learning and science, and the systematisation of the sciences by the founding of numerous universities and literary institutions, the aim of these latter being the diffusion of general knowledge and sound practical science. Many of the magnificent typographical tracts which the great public libraries of Italy abound, belong to this golden age, and are
ITALY.

Knowledge drawn from the 16th c., one of the most noted being the academy Della Crusca, founded at Florence for the preservation and perfecting of the Italian language.

The 17th c., if less prolific in great literary names than its predecessor, is nevertheless the golden age of Italian science; it produced a host of illustrious discoverers in philosophy, mathematics, and physics, the universal name of Italian science. In that period the universities of Florence, Naples, Pisa, and Venice were thronged with foreign students. Learned societies for the cultivation and practical demonstration of the physical sciences were opened throughout Italy (the Accademia dei Lincei, the Collegio of Leonard, the Accademia of the Sciences, etc.).

The 18th c. saw the gathering of a vast number of talent in Italy, whose works have been collected and enriched, to afford every facility to learned research. The most celebrated savants are the world-famous Galileo (q. v.), Torricelli (q. v.), Borelli, the astronomer Cassini (q. v.), and Viviani, the pupil and biographer of Galileo; Malpighi and Bellini, anatomists and physicians. Contemporary with these, we find Gian Vincenzo Gravina, whose lectures on civil law attracted audiences from all Europe. In historical composition, the best known work is that of the critic and historian of Treviso, his History of the Wars of the Netherlands, by Beccaria (q. v.), a work of the great master of literature, and a vehicle on political and social science.

The poems of the 17th c., at least Marinii (q. v.), a poet and a school, display a degenerate taste. Fondness for trivial conceits, false glitter, and artificiality, are their characteristics; but several of his contemporaries—Lilly and Vincenzo Foggia, in particular—are admirable. His History of the Wars of the Netherlands, by Beccaria (q. v.), is a work of the great master of literature, and a vehicle on political and social science.

The 18th c. is a period of political revolution, and the conflict of old and new ideas. In literature, the schools of France, England, and Germany were in direct opposition to the Italian schools. The most noted of the schools of France was the Parisian, which flourished under the name of the French academy. The schools of England and Germany were also important, the former under the name of the London academy, the latter under the name of the Berlin academy. The schools of Italy were the Accademia dei Lincei, the Collegio of Leonard, the Accademia of the Sciences, etc.

The 19th c. saw the gathering of a vast number of talent in Italy, whose works have been collected and enriched, to afford every facility to learned research. The most celebrated savants are the world-famous Galileo (q. v.), Torricelli (q. v.), Borelli, the astronomer Cassini (q. v.), and Viviani, the pupil and biographer of Galileo; Malpighi and Bellini, anatomists and physicians. Contemporary with these, we find Gian Vincenzo Gravina, whose lectures on civil law attracted audiences from all Europe. In historical composition, the best known work is that of the critic and historian of Treviso, his History of the Wars of the Netherlands, by Beccaria (q. v.), a work of the great master of literature, and a vehicle on political and social science.

ITASCA—ITCH-MITE.

and Rosini have written the best dissertations on art. Biography, which as yet has been somewhat neglected by Italian writers, has found in Professor Volpini and in Professor R. Rosini (Volpini and Rosini) the best cultivation; whereas on the other hand, the most complete histories of Italian literature are Crescianini, Storia della Volga Poesia, 6 vols. (Rome, 1898); Venice, 1731); Quadro, Storia e Regione d'ogni Poesia, 7 vols. (Bologna, 1720); Tifabolosi, Storia della Letteratura Italiana, 14 vols. (Modena, 1772—1783; 16 vols. 1787—1794; 12 vols. Rome, 1785; 16 vols. Milan, 1822—1826); Corniani, Scoli della Letteratura Italiana, 9 vols. (Brescia, 1818—1819); Maffei, Storia della Letteratura Italiana, 21 ed., 4 vols. (Milan, 1834); Giorielli (Milan, 1845); Giudici (Florence, 1847); Levati (1853).

ITASCA. LAKE. SEE MISSISSIPPI.

ITCH (known also as SCABIES and PSORA) is a contagious vesicular disease of the skin. All parts of the body, unless perhaps the head, are liable to be affected, but the most common seats of the eruption are the wrists and hands, especially between the fingers. The first sign of this affection is an itching sensation, which, upon minute examination, is found to proceed from a minute conical vesicle, while the adjacent portions of the skin remain as smooth as before, and a more scaliness of appearance than is natural. This condition of the skin is due to the presence of a minute acarus, the ITCH-MITE (q.v.), which burrows within the epidermis, and excites the cutaneous irritation. The affected parts itch with increased intensity when the patient is warm in bed, or after the use of stimulating drinks or exciting condiments; and as he cannot refrain from scratching himself, the vesicles get more or less broken, and become interpersed with numerous little bloody points.

The itch being popularly regarded as a somewhat disreputable affection, and being highly contagious, it is very important that it should be distinguished from other cutaneous disorders. Eczema, prurigo, and lichen, are the affections most likely to be confounded with it; but eczema, though a vesicular disease, presents rounded and not conical vesicles, and at most only a prickling sensation, and nothing like the irritation of itch; while prurigo and lichen are not accompanied, and are not accompanied by the presence of vesicles; moreover, none of these diseases are contagious.

The itch is always communicated by contact, either directly or by the dress and linen of the person in its perfect form; while in other cases, the ova or embryos suspended in the fluid of the vesicles may be the mode of transmission.

The disease, if not cured, will go on for an indefinite period, probably for life; but in cold and temperate climates, the worst and most serious injury to the health. Numerous external remedies have at different times been employed for the cure of this disease, but the great remedy is sulphur, which may be regarded as a specific. In the case of William Ernestus Willing, the English authority on skin-diseases, recommends that "four ounces of sulphur ointment should be well rubbed into the entire skin before the fire, and particularly into the affected portions, morning and evening, for two days. It is desirable also, that the patient should wear a flannel shirt, and retain the same during the whole of the treatment. On the morning of the third day, the patient should take a warm bath, and wash the skin thoroughly with plenty of soap, when the cure will generally be found to be effected.

The mite is strongly object to the smell of sulphur, which is not infrequently the case, an ointment made by digesting over a vapour-bath, for 24 hours, three parts of stearine powder, with five parts of lard, and then straining, may be used. According to M. Bourguignon (who has made numerous experiments on the deleterious action of medicines on the living itch-mite), this ointment will cure the disease in four days.

ITCH-MITE (Acarus scabiei or Sarcoptes scabiei) is supposed by some naturalists to have been referred to the group Arachnida, the 5th order of the Historia Animalia, cap. 31. But although the itch was undoubtedly known both to the Greeks and Romans, there is no certain evidence that a mite was recognized as the cause of the disease earlier than by Arezzoorz, an Arabian physician of the 12th century. Throughout the whole of the middle ages, and till the present century, the necessary connection between the disease and the mite must have been lost sight of; and we read the writings of Scaliger (1557) and others; and a paper read by Adams before the Royal Society in 1805, contains two very good figures of the mite. During the first ten years of this century, many persons have been suspended in colleg and investigated; and it has been expressed doubts concerning its existence, and in 1812 there occurred a remarkable incident in the history of this mite. M. Gales, the chief apothecary to the Hospital of St Louis, tempted by a prize of 200 francs offered by one of the unbeknown, published in that year a treatise on the itch, in which he declared that he had seen more than 300 of the mites, and in which he gave a drawing of the animal, which, although it differed materially from the delineations of former writers, was accepted as an exact representation of the true parasite, and was copied for several years into all works treating the itch, until Raspail discovered that M. Gales's Memoir was a tissue of deceptions, and that the animal which he had figured was the close mite. The existence of the itch-mite was now more distrusted than ever, until, in 1834, Renucci, a Corsican student, demonstrated the presence of the creature. Many points regarding the structure and habits of this curious animal have been since illuminated by communications of Graus, Raspail, Hebra, Gudden, and especially De la Foad and Bourguignon, who have presented to the French Institute A Practical Treatise on the Entomology and Comparative Pathology of the ITCH, as it occurs in Man and the Domestic Animals, which has been published in the last volume (1862) of the Memoires presents par divers Savants a l'Academie des Sciences.

The adult female mite is considerably larger than the male; it is visible to the naked eye, and forms a roundish grayish-white corpuscle, not unlike a starch granule; it is about 15th of a line in length, and 4th in breadth. When seen under the microscope, it presents a transverse striated line of some 15th of a space, and is observed to be studded with hairs and bristles. The head terminates in two pairs of mandibles, and as these mandibles afford good characteristic distinctions of the species, representations are given in fig. 2 of the male and female mites; our highest mite in fig. 3 of the female, and in fig. 3 of the male mite in the sugar-mite.

In order to penetrate the horny layer of the epidermis, the mite assumes, according to Gudden, a nearly perpendicular position; and to avoid as much trouble as possible, it usually selects such cases as give least resistance, such as the space between the fingers, the inside of the wrist, &c. Once fairly buried, it does not again come out, but burrows, and
forms tortuous galleries within the skin. These galleries resemble the mark which is formed when a pen is drawn lightly over the skin without causing a scratch. In young children, and in persons with a delicate skin, they appear of a grayish-white color; while in persons with a coarse dirty skin they are of a blackish tint. At certain intervals, the galleries are pierced by small openings, for the admission of air; it is through these openings, which sometimes appear like very minute black dots, that the young escape. The vesicles characteristic of the itch-disease are attributed to a poison ejected by the mite. The males are smaller and much scarcer than the females.

There are numerous species of itch-mite (Sarcoptes) which infest the lower animals. One of them (S. ovis) produces Mange (q.v.) in dogs; another (S. equi), a comparatively large species, sometimes occurs in horses; another (S. bovis) in oxen in some parts of Europe; another (S. orei) in sheep. Some of these are occasionally transferred to human beings, and cause irritation and annoyance, which, however, seems to be limited to the life of the individual mites transferred, the situation not being congenial enough for their increase.

For further information on the structure and habits of this animal, the reader is referred to the second volume of Küchenmeister's work on Parasites (translated for the Sydenham Society), and to Bourguignon's treatise.

ITHACA (now THAKI), one of the Ionian Islands (q.v.), and the smallest of them except Paros. It lies 17 miles west of the mainland of Greece, and 2 miles north of Cephalonia. The surface is mountainous, but there are many pleasant valleys. Length, 15 miles; breadth, 4; area, about 44 square miles. It was celebrated among the ancients as the principality and home of Ulysses; and some Cyclopean ruins near Porto Molo are called by the islanders the ruins of the Castle of Ulysses. In 1858, the population of the island amounted to 11,438, of whom about 2,900 were in the town of Vathi, its seaport and capital.

ITHACA, a village in the state of New York, America, at the southern extremity of Cayuga Lake, 162 miles west-by-south from Albany. It has a large trade in coal, and 30 mills and manufactories. Pop. (1860) 6843.

ITHINERARY (Lat. Itinerarium, derived from iter, a journey), the name given by the Romans to a table of the stages between two places of importance, with the distances from one to another. The itineraries of the ancients contribute much to our acquaintance with ancient geography. Of these, the most important are the Itineraria Antonini and the Itinerarium Hierosolymitanum. The Itineraria Antonini are two in number, the Itinerarium provinciarum and the Itinerarium maritimum, the former containing the routes through the Roman provinces in Europe, Asia, and Africa; and the latter the principal routes of navigators, who then sailed only along the coasts. They take their name from Antoninus Caracalla, by whom they were published, as corrected up to his time, but they seem to have been originally prepared at an earlier date. The Itinerarium Hierosolymitanum was drawn up 333 A.D., for the use of pilgrims from Bufdaga (Bordeaux) to Jerusalem. Of these itineraries, various editions have been published.

ITINERATING LIBRARIES are small collections of books for popular reading contained in boxes, one of which, after being stationed in a village for a certain length of time, is transferred to another village, when another takes its place; and so on with any assigned number of boxes, each with its special assortment. The principle of shifting about boxes of books in this way in rural districts is referred to in the Memoirs of Oberlin (q.v.), and has been long known in Wales, as well as the Highlands; but it met with no significant application until it was improved upon and carried practically into effect on a broad scale by Samuel Brown, a merchant in Haddington (died 1839), who, taking a deep interest in popular instruction, set on foot itinerating libraries in several villages of East Lothian, 1817. The books were assorted to the extent of 50 volumes in a box. At first, there were four boxes; and as the time allowed for each was two years at a village, the inhabitants of four villages had the perusal of 200 volumes in the space of eight years, at one-fourth the expense of the whole. The undertaking was begun and locally superintended from motives of benevolence, and the books were supplied gratuitously. The success attending this economic method of establishing libraries in a country district, led to its extension over a wider sphere, on the principle of readers paying a small sum per annum, also of forming the assortments of books from the uses of new works, in a central subscription library. In 1862, there were 18 itinerating divisions in use in East Lothian, while there are several elsewhere in Scotland, as also in England, and 12 divisions were lately transmitted to Jamaica, where they are to be under the charge of missionaries. From all that can be gathered, the establishment of libraries of this simple class proves a valuable auxiliary to schools, churches, and other agencies of social improvement. For a variety of particulars on the subject, see a small volume, Some Account of Itinerating Libraries and their Founder (Edin. 1856).

ITZEHOF, a town of Denmark, in the duchy of Holstein, and the oldest in the duchy, is situated on the Stor, in a valley bounded by tall wooded hills, about 50 miles by water north-west of Hamburg. Tobacco, chicory, sugar, and brandy, are manufactured, and important horse and cattle markets are held here. It also carries on a considerable general trade by water with Altona and Hamburg. Pop. 6691.

The original castle around which there gradually arose was built by Charlemagne in 996. It was twice taken by Tilly in the Thirty Years' War, and in 1567 a great portion of it was burned down by the Swedes.

IVAN, or IWAN (the Russian form of John), the name of a number of Russian czars. IVAN I (1462—1505) may be regarded as the founder of the Russian empire. He was at first only Grand Duke
of Moscow, but succeeded in shaking off entirely the yoke of the Tartars, and in subjecting a number of the Russian principalities to his own sway. In 1448, he married a niece of the last Byzantine emperor, and thus brought the two-headed Byzantine eagle into the Russian arms, an emblem with which are connected pretensions not likely to be forgotten by the Russian emperors, although they may not be acknowledged. This marriage opened up a way also for the entrance of European civilisation into Russia.—IVAN II. (1533 - 1584) did much for the advancement of his country in arts and commerce, as well as for its extension by arms. He concluded a commercial treaty with Queen Elizabeth, after the English had discovered the way to Archangel by sea. He bore, however, the surname of the Cruc, and merited it by his deeds, amongst which was the slaughter of 60,000 persons—other accounts make the number only 25,000—at Novgorod in six weeks, on account of a supposed plot to deliver up the city and surrounding territory to the king of Poland. —IVAN III., born 21st August 1470, was the son of the Duke Anthony Urne of Brunswick-Wolfen- bild, and the Russian Grand Duchess, Anna Carlowna. The Empress Anna Ivanowna adopted him as her son and heir, but she dying soon after, and Elizabeth, the daughter of Peter I., seizing the throne, he was imprisoned during the remainder of his life; and on the death of the Empress Catharine II. or of her counsellors, was put to death by the officers of the garrison at Schliassburg, where he was confined, on 5th December 1764. Those Russian Ivan are sometimes differently num- bered, the reckoning being made to begin further back, with those who were only Grand Dukes of Moscow.

IVES, Sr, a municipal and parliamentary borough of England, in the county of Cornwall, beautifully situated on the north-east shore of the bay of the same name, with an outlook on the Bristol Channel, about 10 miles north-north-east of Penzance. It is a very old and picturesque town; its church, a granite building of the early part of the 15th c., stands on the beach, and is reached by the spray in rough weather. Its harbour admits vessels of 200 tons. I. is the head-quarters of the pilchard-fishery. In the vicinity are several important tin and copper mines. Pop. (1861) of parliamentary borough, which returns one member to parliament, 10,354.

IVES, Sr, a small market-town of England, in Hants, is situated on the left bank of the Ouse, 6 miles east of Huntingdon. A very large weekly cattle and corn market is held here. Brewing and malting are the chief branches of industry. Pop. (1861) 3221.

IVIZA (anc. Elomos), one of the Balearic Isles (q. v.), lies about 50 miles south-west of Majorca. It is 23 miles long, and 12 miles broad; pop. 11,000. Iviza, the chief town, has a pop. of 5100. Salt, the principal article of export, is extensively manufactured on the shore.

IVORY was the name formerly given to the main substance of the teeth of all animals, but it is now restricted to that modification of dentine or tooth-substance which in transverse sections shows lines of different colours running in circular arcs, and forming their drecession what we call segmental spaces. By this character, which is present by every portion of any transverse section of an elephant's tusk, true ivory may be distinguished from every other kind of tooth-substance, and from every counterfeit, whether derived from tooth or bone. Although no other teeth, except those of the elephant, present this characteristic, many other animals, such as the walrus, narwhal, hippopotamus, &c, possess teeth, horns, or tusks, which, from their large size and from their density, can be used for the same purposes in the arts as those for which true ivory is employed. The ivory of the tusks of the African elephant is held in the highest estimation by the manufacturer, on account of its greater density and whiteness. The tusks are of all sizes, from a few ounces in weight to more than 100 lbs. in weight. They are furnished from the banks of the rivers of Northern Siberia which weighed 180 lbs each. There are various chemical processes by which it may be dyed of various colours, as black, blue, green, yellow, red, and violet.

Ivory articles can be made flexible and semi-transparent by immersion in a solution of phosphoric acid of sp. gr. 1.120, till they become translucent. They are then to be taken out, washed with water, and dried with a soft cloth, when they are found to be as flexible as leather. They harden on exposure to dry air, but resume their pliancy when immersed in hot water.

Much important information on the subject of ivory generally will be found in Holtzapffel's Mechanical Manipulation.

The tusks of the elephant have from very early periods constituted an important article of trade, in connexion with the great beauty as a material for ornamental manufactures, and even with the arts. I. is frequently mentioned in the Old Testa- ment. With the Greeks it became a most important material, and by the hands of the sculptor Phidias a statue was made of the Olympian god for such marvellous beauty and imposing majesty that it was considered a misfortune to die without having seen it. By the Romans, who were supplied from Africa, it was also extensively used, and by them it was diffused over the whole of Europe. The art of working in ivory doubtless had its origin in India, where it has always been a much valued material, and formerly supplied indirectly much of the ivory sent to Europe. The value of ivory is in proportion to the size and soundness of the tusk. Below the weight of five pounds, they are called severilles, and are of the least value, rarely reaching five shillings per pound; but double that price has been given for teeth of unusually large size. The average price imported into Great Britain of all parts rather exceeds 500 tons per annum, the value of which is nearly £400,000.

The so-called ivory obtained from the hippo- potamus is a special favour with dentists for making false teeth, on account of its pure white colour and freedom from grain. The fossil ivory, which is found in considerable quantity in Siberia and the arctic regions, is uncommonly hard and brittle; it is also whiter, and wants its waxy soft- ness. At present, the demand for ivory is rapidly increasing, owing to the great taste and skill of some of the artists who work in this material, and as the supply increases but very slowly, it is likely to become very dear. The works in ivory exhibited in the International Exhibition (1862) showed a very extraordinary advance in the beautiful art of ivory- carving, and single specimens were shewn of the value of £3500.

IVORY, VEGETABLE. This curious material is furnished by one of the most beautiful of all the palm tribe. It grows on the Andean plains of Peru, and on the banks of the river Magdalena, and other parts of South America. The stem of this palm (the Phylodendron metasecne) is short and procumbent, but it has, proceeding from its crown, a magnificent tuft of light-green pinnated leaves of extraordinary size and beauty; they are like immense ostrich-feathers rising from 9 to 40 feet in
IVORY-BLACK—IVY.

The flowers are on a crowded spadix, and have neither calyx nor corolla. The fruit, which is as large as a man's head, consists of many 4-celled leathery drupes aggregated together, and contains numerous nuts of a somewhat triangular form, each nut being nearly as large as a hen's egg; they are called Corvezzo nota in commerce. The kernels of these nuts when ripe are exceedingly hard and white, in fact they resemble ivory so completely that few names have ever been better applied than that of vegetable ivory. They have of late come into extensive use by turners in the manufacture of buttons, umbrellas-handles, and small trinkets, and so closely resemble true ivory as frequently to deceive competent judges. Two or three millions of these nuts are now imported annually, and are chiefly used by the London and Birmingham turners.

IVORY-BLACK. See Bone-Black.

IVRY, a town of Piedmont, and capital of a province of the same name, has a population of 9238, and is situated on the left bank of the Dora Baltea, partly on level ground and partly on an eminence exposed to the sirocco winds. The cathedral is supposed to have been a temple of Apollo, and contains an ancient sepulchral monument of the age of Augustus. The cathedral is famed for its picturesque allegorical pageants.

IVRY-SUR-SEINE, a manufacturing town of France, in the department of Seine, is situated on the left bank of the river of that name, three miles above Paris. Glass, earthenware, and chemical products are the chief manufactures. Pop. 8679.

IVY (Hedera), a genus of plants of the natural order Araliaceae, consisting of shrubs and trees, mostly natives of tropical countries. The flowers have five or ten petals, and five or ten converging or consolidated styles. The fruit is a berry with five or ten cells. The Common Ivy (H. helix) is a well-known native of Britain, and of most parts of Europe, although it is more rare in the northern countries. Its long, creeping, branched stem, climbing on trees and walls to a great height, and closely adhering even to very hard substances by means of rootlets which it throws out in great abundance along its whole length, acquires in very aged plants almost the thickness of a small tree. Its 5-lobed, shining, stalked, evergreen leaves, clothing bare walls with green luxuriance, serve to throw off rain, whilst the rootlets of the stem suck out the moisture, so as to render damp walls dry, contrary to a common prejudice, that ivy tends to produce dampness in walls. It injures trees, however, both by abstracting their sap and by constriction. The flowering branches of ivy have ovate, entire leaves, very different from the others. Its small greenish flowers are produced in the beginning of winter, and the small black berries are ripened in the following year. The berries are eagerly eaten by many birds, although they have a pungent taste, and contain a peculiar bitter principle called hederine, and an acid called hederic acid; which are also found in a gummy exudation obtained by incisions from the stem, and occasionally used in medicine as a depilatory and a stimulant, and in varnish-making. An ointment made from the leaves is used in the Highlands of Scotland to cure burns. In Egypt, the ivy was sacred to Osiris, in Greece to Bacchus (Dionysos), whose thyrsus was represented as surrounded with ivy; the Romans mingled it in the laurel crowns of their poets.

There are several varieties of ivy often planted for ornamental purposes, of which that generally known in Britain as Irish Ivy, and on the continent as English Ivy, is particularly esteemed for its large leaves and luxuriant growth. It is said to be a native of the Canary Isles. Ivy grows readily from cuttings.—H. umbellifera, a native of Ambaya, is said to produce a finely aromatic wood; and H. terebinthacea, a Ceylonese species, yields a resinous substance which smells like turpentine.
THE tenth letter in our alphabet, has in Eng. the power of ikh; in Fr., of eh; and in Ger., of y. Both the sound and the character have sprung out of the original vowel i. When such a word as Julius is pronounced rapidly, it naturally slides into Yulius. The Romans, though they had but one character for both, recognised this distinction between the vowel and the semi-vowel; and in the case of such words as cuius, maïus, some writers doubled the i, and wrote one or both long, as cuilus or cuius. There is little doubt that the original Roman sound of this semi-vowel was that of Eng. y (youth), still given to it in German. But as this sound has a tendency to convert the consonant preceding it into a sibilant (see letter C), so it has a tendency to become itself sibilant, and Yul-slide into Fr. zhul-, Eng. zhul-. This transition had already taken place in the later ages of the Latin, at all events, in the popular pronunciation, as appears from such inscriptions as conjuncta, for conjuncta; Zew, for Jevu.

It was the Dutch scholars of the 16th and 17th centuries that first introduced a regular distinction between the consonantal and vowel powers of i, and marked the former by the distinct character j (a long i, projecting below the line). The character has been adopted in the modern Teutonic and Romanic languages, with the exception of Italian, which represents the sound by gi or gij, as Giovanni, from Lat. Johannes; maggiore, from Lat. maior. In Span., it has a guttural power, and is interchangeable with x, as Xerex, or Jeres.

JABIRU (Mycteria), a genus of birds of the same family with storks and adjutants; the chief distinction from the storks being that the bill is a little curved upwards. The species are few, but are widely distributed in South America, Africa, and Australia.

JABUTICABA. See Eugenia.

JA'CANA (Parru), a genus of birds of the order Grollax, commonly ranked in the family Balikax, natives of the warm parts of Asia, and the Asiatic islands, Africa, and South America. In general appearance, they much resemble gallinules and coots. They are not adapted, by the great length of the toes and claws, for walking on the surface of weed-covered lakes and swamps, the native haunts of these birds, where they never fail to attract the attention of the traveler.

The Common J. (J. jacana) is a South American species, abundant in Guiana and Brazil. It is about ten inches long; black, except the back and part of the wings, which are of a bright chestnut colour. The Indian J. (P. Indica) and the Chinese J. (P. Sinensia) are also among the best known species. Both are found in India and other parts of the East.

JACAR'ANDA WOOD, a very hard, heavy, brown wood, also called Rosewood, from its faint agreeable smell of roses. It is brought from South America, and is produced by several trees of the genus Jacaranda, of the natural order Bignoniaceae. Several species of this genus are called Caroba in Brazil, and are there accounted anti-syphilis. Several species of the nearly allied genus Tecons also have an extremely hard wood, as T. pentaphylla, a native of the Caribbean Islands. The Brazilian Indians make their bows of the wood of T. tacophora or Pao d'arco.

JACK. 'The Jewish Jacobus was corrupted through Jaquesmes to Jaques in France, and James in England; and Jaques being the commonest Christian name in the former country, was used as

Australian Jabiru.
The term was then applied to any mechanical contrivance for replacing the personal service of an attendant, or to an implement subjected to rough and familiar usage.—Wedgewood's Dictionary of English Etymology. This will be found to explain the very varied use of this word, whether single or in composition; as boot-jack, jack-boots, black-jack (a leather jug for household service). "Jack (the diminutive of Jack) is a short coat for homely use."

JACK, JAK, or JACA (Artocarpus integrifolia), a tree of the same genus with the Bread-fruit (q.v.), a native of the East Indies. It is a larger tree than the Bread-fruit, and has undivided leaves. The fruit is very large, weighing from five to fifty, sometimes seventy pounds. The fruit, which is produced in very great abundance, resembles the Bread-fruit, but is of very inferior quality, the pulp having a strong nauseous flavour; yet it forms great part of the food of the natives in some parts of India, Ceylon, &c. The seeds, which lie immediately under the rind, are very palatable when roasted. The timber, which is yellowish, is used for almost every purpose, being both strong and ornamental, and is imported into Britain for making musical instruments, cabinet-work, the backs of brushes, marqueterie floors, &c. The J. is now much planted in many tropical countries of which it is not a native.

JACK-A-LANTERN. See JAQUES FATTUS.

JACKAL (cropped from Sp. and Fr. chauvie), the common name of a number of species and varieties of the dog genus, abundant in many parts of Asia and Africa, but not found in any of the other quarters of the globe, except that one of the kinds extends into Greece. They agree in all their most important characters with wolves and dogs, and many naturalists suppose that some of the domestic varieties of dogs are of jackal parentage. The pupil of the eye is circular, as in the dog and wolf, although the form and tail are somewhat different. The head is narrow, and the muzzle pointed. The ears are erect, and rather large. The tail is not so long as in foxes, but is almost equally bushy. All the jackals are of small size, as compared with the wolves, seldom exceeding 15 inches in height at the shoulder. Their colours are buff and tawny, more or less grizzled; the tip of the tail is always dark. They make holes for themselves in the ground by burrowing, or take possession of such as already exist among rocks or ruins; and in these they spend the day, not venturing abroad till the dusk of evening. They hunt during the night in troops, and their howlings are described by all who have heard them as peculiarly horrible. The notion that the J. is the lion's provider, and guides the royal beast to his prey, is one of the exploded fables of natural history. Although it may have been formerly the custom in the lion's occasionally following a troop of jackals in full cry, and appropriating 'the lion's share.' Jackals are not only ready to devour any animal which they can run down, but any carrion which they may meet with. They follow armies; they dig up the ill-buried dead; they rob hen-roosts and outhouses; but they are as omnivorous as domestic dogs, eating farinaceous or other vegetable food when it comes in their way; they are even said, like foxes, to enter vineyards, and devour the grapes. They have a very offensive smell, which, however, is said to diminish through domestication, and they are domesticated without difficulty. The name of Common J. is sometimes given to the species (Canis aureus) which is found in the western parts of Asia, and which is in general yellowish gray above, and whitish below, with yellow legs and thighs. But it is doubted if this animal was an ancient breed, or if it is in the eastern and neighbouring parts of Asia. It is thought not improbable that it may have followed the track of armies from the farther east. It is pretty certain that it has, in comparatively modern times, become common in many parts of Asia more recently than it was formerly inhabited. It is not improbable, however, that it is included under the name fox in the Hebrew Scriptures.

JACKASS, LAUGHING (Dacelo gigas), a bird of the Kingfisher family (Holegowers), and sometimes described as a sort of natural badge of the Great Brown Kingfisher. It agrees very nearly with the kingfishers in its form and characters, but differs from them in its habits, not frequenting waters, nor fishing on fish, but preying on beetles, reptiles, and small mammalia. It is about eighteen inches long, and mostly of a brown colour. It is a common bird in Australia, and has received its English name from the colonists, on account of the peculiar sounds which it utters. The nates call it Gogobera, apparently in imitation of its cry. It is of great use in preventing the excessive multiplication of reptiles and other pests. Its bill is powerful enough to crush the heads of snakes. It is easily tamed, and is sometimes kept in gardens, from which it does not seek to escape.

JACK-BOOTS, tall boots of tough thick leather, reaching above the knee, and formerly worn by cavalry. In some instances, as an additional protection against sword-cuts, they were lined with thin plates of iron. The only regiments in the British service which still retain these handsome but cumbersome boots are the Life Guards and Royal Horse Guards. See Boors.

JACKDAW (Corvus monedula), a species of crow, smaller than the rook and carrion crow, its utmost length being only about fourteen inches. It is black, with dark-gray neck. It is a common British bird, and is plentiful also in some parts of continental Europe, Asia, and the north of Africa. It is not found in America. It builds its nest in holes of cliffs, ruins, or trees, if room is had, but if not, it often makes its nest in a chimney, by dropping down stick after stick till some of them become fixed in their oblique descent; and on these, others are piled, affording a firm base for the nest, or shelter for incubating. The J. lays from four to seven (usually five) bluish-white eggs, which are covered with dark-brown spots. Marvelous instances are recorded of the quantity of sticks employed to form a jackdaw's nest, a situations

660
where an unusual height of pile was required. In 1842, a pair of jackdaws, in seventeen days, made a pile ten feet high in the staircase of the bell-tower of the Old North Church, Boston. It is easily domesticated, and becomes very pert and familiar. It has considerable powers of mimicry, and even imitates the human voice.

JACKSON, a town of North America, capital of the state of Mississippi, is situated on a plain on the right bank of the Pearl River, which becomes navigable here, forty miles east of Vicksburg, and about 180 miles north of New Orleans by railway. Being the capital, it is the seat of several important state institutions, as the lunatic asylum, institutions for the deaf and dumb, and the prison. Here, in average years, from 30,000 to 40,000 bales of cotton are shipped annually. Pop. about 6000.

JACKSON, a flourishing city of North America, in the state of Michigan, is situated on the left bank of the Grand River, 76 miles west of Detroit, and 33 miles south of Lansing, with both of which it is connected by railway. In the vicinity, are numerous factories and mills of various kinds. Agricultural implements are extensively manufactured here, and there is a flourishing general trade. Within its corporate limits, there is a mine of bituminous coal—that material occurs also in the vicinity. Pop. 6510.

JACKSON, ANDREW, General, and seventh President of the United States of America, was born at Waxhaw settlement, South Carolina, March 15, 1767. His father, who was a Scotchman by birth, emigrated to America in 1765, and soon afterwards died, leaving to his widow a half-cleared farm in a new settlement, with no negroes to assist in its cultivation. When J. grew up, he was sent to study for the church, but on the breaking out of the American revolution, he and his brothers were summoned to the field, and the elder lost his life at Stono Ferry. Andrew, though but thirteen years old, fought with his remaining brother under Sumter, and remained with the army until the end of the war. The life of the camp had ruined him for the clerical office, so in 1784 he commenced the study of the law, and in 1787 was appointed solicitor for the western district of South Carolina, now the state of Tennessee. This frontier settlement had for its neighbors several powerful tribes of Indians, against whom J. fought with such success as to get from them the complimentary titles of 'Sharp Knife' and 'the Arrow.' In 1796, he was a member of the convention which modeled the constitution and organised the state of Tennessee, and was elected to the legislature as representative, and then as senator, and appointed judge of the supreme court (an office he soon resigned), and major-general of the state militia. In 1813, at an outbreak of hostilities with the Creek Indians, he raised a volunteer force of two or three thousand men, and defeated them. In the want of supplies, he is said to have set an example of endurance by feeding on hickory-nuts, and hence, according to some, to have acquired the popular sobriquet of 'Old Hickory.' J.'s final victory (March 27, 1814) at the Battle of New Orleans, in the Tallahasseo, completely broke the power of the Indian race in North America. In consequence of his skill and energy in Indian warfare, he was appointed a major-general of the army of the United States; and having won a temporary war with England had command of the forces which captured Pensacola, and defended New Orleans (q. v.) against the attack of the British under General Packenham, December 1814. The result of this action, so flattering to the pride of Americans, gave General J. a great and enduring popularity. After Spain had ceded Florida to the United States, he was made governor of the territory, and subsequently commanded troops against the Seminoles from 1818 to 1821. In 1824, he received the highest vote of four candidates for the presidency of the United States, but by the influence of Mr. Clay, John Quincy Adams was elected by the House of Representatives. He died, however, in spite of bitter and violent opposition, elected by the democratic party in 1828, and in 1832 re-elected by a still more overwhelming majority. His administration was marked by singular firmness. He vetoed important measures against large majorities, and after a long struggle, destroyed the Bank of the United States, and took the first steps towards a species currency and independent treasury. But he manifested too much, perhaps, of a partisan spirit in removing nearly all his political opponents from office, and appointing his supporters—an example followed by his successors of both parties, and which has led to wide corruption. His administration, as a whole, was devoid of any extraordinary qualities, though strongly marked by the prudence, firmness, and determination which marked the man. He was, in turn pursued by Frémont, Shields, and Banks, but escaped, and united his division to the army under Lee, at Richmond, enabling that general to defeat the army under McClellan. Upon the invasion of Maryland, J.'s division operated against Harper's Ferry, which was captured Sept. 15, 1862. He died of wounds received from his own men at Chancellorsville, May 9, 1863.

JACOB (Heb. יִֽאָכָּב, derived variously from 'heel,' Gen. xxvi. 26, or from 'to deceive,' Gen. xxvii. 19). Jacob is a Jewish name.

He was the second son of Isaac and Rebekah, and on account of his docile, domestic character was the favourite of his mother. His conduct towards his brother in regard to the birthright (Gen. xxvi. 27) does not greatly redound to his credit. After an exile of 21 years in Padanaram, whither he had fled to escape the vengeance of Esau, he returned to Canaan with two wives (Rachel and Leah), two concubines (Bilhah and Zilpah), twelve sons, and forty-two other males (successors by tribes), and a daughter named Dinah, who was the unintentional cause of a vindictive massacre of the Shechemites by her brothers Simeon and Levi. In his 130th year, he and his family went down to Egypt, where his favourite son Joseph became a great man under Pharaoh. Here he lived for 17 years longer in the land of Goshen, and died in his 147th year. His body was embalmed, carried back to Canaan with a great pomp by his sons, and there buried near Hebron. Mention is frequently made of J. both in the Old and New Testaments, and there are also many legends about him in Babylonian and Patriotic, as well as in the Mohammedan literature.
JACOBI, FRIEDRICH HEINRICH, a German philosopher, born at Düsseldorf, 25th January 1743. He was educated at Frankfurt, whence he proceeded to Geneva with a view to preparing himself for a mercantile career. In 1770, he was appointed councillor of finance for the duchies of Berg and Jülich, and having married a lady of fortune, was enabled to devote himself to literary pursuits. In 1804, he removed to Munich, where he had been appointed a member of the newly instituted Society of Sciences, of which he became president in 1807. He died on March 10, 1819. His writings consist partly of romances, and partly of philosophical treatises. The principal are "Wohlerum" (2 vols. 1778), "Edwards Briefe an Bilderdau" (Bresl. 1751), both philosophical romances; "Ueber die Lehre des Spinoza in Briefen an Mendelssohn" (Bresl. 1753), a polemic against logical methods of speculation in the search after the higher class of moral truths; and "David Hume über die Glauben, oder Idealisimus und Realismus", in which the same polemic is continued, but in which an attempt is also made to demonstrate that the mind or nature of man possesses another faculty—viz., faith, or moral intuition, by which the highest things are firmly grasped, as, by faith in the perceptions of the senses we, so to speak, lay hold on the phenomena of the material world. Herein lies the difference between Kant (and indeed the whole school of German idealists) and J.; the former appear to admit only the 'subjective' reality of such conceptions as God, the soul, immortality, &c.; the latter claims for them an 'objective' reality. Kant declares that the 'faculty of faith' gives us 'knowledge,' in the strict sense of the word; J. affirms that it does. One of his treatises, "Von den göttlichen Dingen und ihrer Offenbarung" (Leip. 1811), was the occasion of a rather sharp controversy between him and Schelling, yet it is not a systematic treatise, and did not form a school. He is, as might be expected, deficient in the qualities he despised—method and logical sequence; but his style is remarkably good, possessing both warmth and clearness. It has been compared by his countrymen to that of Plato. His collected works appeared at Leipiz (6 vols. 1812—1824).

JACOBI, KARL GUSTAV JAKOB, a celebrated mathematician, was born at Potsdam, in Prussia, 10th December 1804; studied at the University of Berlin, where he was a great progress in mathematics, physics, and mathematics; and in 1829 became a professor at Königsberg. In 1829, he published his celebrated work "Fundamenta nova Theoria Functionum Ellipticarum", for which he received the great medal of the Academy of Sciences of Paris; the work, however, only contains a portion of his researches on the subject of Elliptic Functions. In the same year, he made a tour through Northern Germany and France, forming the acquaintance of Gauss, Legendre, Fourier, Poisson, and other celebrated geometers. In 1842, he took a second journey, in company with his wife, to visit England and Scotland, and attend the meeting of the British Association. Soon after his return home, his health broke down, and he started for Italy. On his return, he was removed from Königsberg to Berlin, where he died of small-pox, 18th February 1851. Besides the work above mentioned, J. wrote a great many tractates on the different branches of the higher mathematics, chiefly Series and Definite Integrals, and was a regular contributor to the celebrated "Journa für reine und angewandte Mathematik" of Crelle.

JACOBIN, the name by which members of the Dominican order were popularly known in France. The name originated from the fact, that their mother-establishment was situated in the Rue St Jacques, in Paris; and it was thence extended to the entire order throughout France.

JACOBINS, the members of a political club which exercised a very great influence during the French Revolution. It was originally called the "Club Brétan", and was formed at Versailles, when the State-general assembled there in 1789. It then consisted exclusively of members of the State-general, all more or less liberal or revolutionary, but of very different shades of opinion. On the removal of the court and National Assembly to Paris, this club began to acquire importance. It now met in a hall of the former Jacobin convent in Paris, whence it received the name of the Jacobin Club, which was first given to it by its enemies; the name which it adopted being that of the Society of Friends of the Constitution. It now also admitted members who were not members of the National Assembly, and became, in the reign of Justine, the Jacobin Club. It exercised a great influence over the agitation of the Socialists, and its political power was at all times. There were many Jacobin clubs throughout France, of which there were soon not less than 1200. When the National Assembly dissolved itself in September 1791, the election of the Legislative Assembly was mainly accomplished under the influence of the Jacobin Club. Almost all the great events which followed in rapid succession were determined by the voice of the clubs, whose deliberations were regarded with more interest than those of the Legislative Assembly. It reached the zenith of its power when the National Convention met in September 1792. The agitation for the death of the king, the storm which destroyed the Girondists, the excitement of the lowest classes against the bourgeoisie or middle classes, and the reign of terror over all France, were the work of the Jacobins. But the overthrow of Robespierre on the 9th Thermidor 1794, gave also the death-blow to the Jacobin Club. The image of its name was destroyed; and the Jacobins sought in vain to contend against a reaction which increased daily both in the Convention and among the people.

JACOBITES, in Church History, is the common name of the oriental sect of Monophysites (q.v.), but it belongs more specially to the Monophysites of Syria, Mesopotamia, and Chaldea. The name is derived from a Syrian monk called Jacobus Baradæus (Baradæus, Baradæus), who formed the Monophysite recusants of his country into a single party. The J. at present number about 40,000 families, and are subject to two patriarchs, appointed by the sultan—one resident at Dairbekir, under the title of Patriarch of Antioch; the other at Saphuran, under the style of Patriarch of Jerusalem.

JACOBITES (from Jacobus, the Latin form of James), the name given to the adherents of the male line of the House of Stuart in Great Britain and Ireland, from the Restoration of the monarchy of the most devoted royalists followed James II. into France; but the greater part of the J. remaining in their native land made a greater or less show of submission to the new government.
JACOB'S LADDER—JACQUARD LOOM.

whilst they secretly supported the cause of the Pretender. Their intrigues and conspiracies were incessant till the middle of the 18th century. Their hostility to the House of Hanover broke out in rebellions in 1745 and 1746, in consequence of which not a few of them lost their lives upon the scaffold, titles were attained, and estates confiscated. After 1745, their cause became so obviously hopeless, that their activity in a great measure diminished; and it was not long before they ceased altogether, and those who still retained their attachment to the exiled family acquired in the order of things established by the Revolution. In Scotland, the hopes and wishes of the Jacobite party were expressed in many spirited songs, which form an interesting part of the national literature. See the Caledonian Papers (London, 1815); Hogg's Jacobite Relics (2 vols. Edin. 1819); and Chamber's Jacobite Memoirs (Edin. 1824).

The J. of England were also called Tories. They were generally distinguished by warm attachment to the Church of England, as opposed to all dissent, if they were not members of the Church of Rome, and held very strongly the doctrine of non-resistance, or that the Jacobite submission was the will of the king. The J. of Scotland were also generally Episcopalian and Roman Catholics. Macaulay, however, points out that the Highland clans who espoused the Jacobite cause did so on other grounds than the English doctrine. Also, in 1745, when they had previously received the doctrine of non-resistance. In Ireland, the Jacobite cause was that also of the Celts as opposed to the Saxons, or the native race against the English colonists at the same time of the Presbyterian Catholics against the Protestants. These diversities prevented a complete union, and greatly weakened the Jacobites. Further information will be found in a History of the Rebellion in 1745, by B. Chambers.

JACOB'S LADDER, in a large vessel of war, is the short rope-ladder, with wooden steps, which slopes inward from the lower portion of the main and fore shrouds to the upper deck. It gives easy access to the shrouds, and thence to the tops.

JACOB'S LADDER (Polemonium careulatum), a herbaceous perennial plant of the natural order Polemoniaceae, a rare native of Britain, but more common in the centre and south of Europe, found also in the temperate parts of Asia and North America. It has long been a favourite and very common plant in flower-gardens in Britain. It has purple, or white, flowers with rosette-like bracts, smooth stem 1—24 feet high, and a terminal raceme of bright blue (sometimes white) flowers, with wheel-shaped 5 lobed corolla. Great medicinal virtues were once ascribed to it, but the only quality which it seems to possess is a slight astrigency, it is to be found in almost every cottage garden.

JACOTOT, JEAN JOSEPH, the inventor of the 'Universal Method' of education, was born at Dijon, in France, in 1770. He served for some time in the army, but in 1790 was appointed by Napoleon, at the chair of mathematics in the Normal School, afterwards secretary to the Minister at War, and a director of the Polytechnic. He retired to Belgium in 1815, where he was appointed lecturer on French literature in the university of Louvain, and afterwards director of the military Normal School. He returned to Paris in 1838, and died there 30th July 1840. His system, propounded in general rules, which, however, without his own explanation, would have been quite unintelligible, appears to consist in directing the student's exertions to particular subjects, encouraging and inviting him in every possible manner to make use of his mental powers, and there leaving him: the teacher is on no account to become an expounder, but after setting the student on the right track, is to leave him to explain away his own difficulties.

J. C.'s method very much resembled that of Hamilton, though he adopted a different system, and, like it, was cruel and one-sided. The valuable elements of it have been incorporated in the more rational and catholic methods of recent times. The wonderful results said to have been produced by this method, which are in reality to be attributed to the exceptional zeal and energy that always characterise the apostle of a new system, as much as to the system itself.

JACQUARD LOOM, a loom fitted with the Jacquard apparatus for the purpose of pattern. To use J.'s apparatus language: 'The iron was sold for iron, the wood for wood, and he himself was delivered over to universal ignominy; yet, nevertheless, on that same spot where the machine was publicly destroyed, a statue now stands, to show the greatness of an enlightened generation.' Even after the partial adoption of his machine, which was patented, J. had numbers of annoyances to contend with; the workmen, as usual, opposed ignorant prejudice to its progress, and for many years he tried to prevent its introduction, but the machine was broken up by the body of men who, under the title of the Conseil des Prud'hommes, were appointed to watch over the interests of the Lyons weavers, and it was destroyed in the public square of Lyon. The J.'s own language: 'The iron was sold for iron, the wood for wood, and he himself was delivered over to universal ignominy; yet, nevertheless, on that same spot where the machine was publicly destroyed, a statue now stands, to show the greatness of an enlightened generation.'

The Jacquard apparatus can be adjusted to almost every kind of loom, its office being merely to direct those movements of the warp threads which are required to produce the pattern, and which previously were effected by the weaver's fingers; its arrangements generally are very complicated, but its advantages are remarkable for their extreme simplicity and certainty.

In ordinary weaving, the alternate threads of the warp, or longitudinal arrangement, are raised so as to enable the weaver to throw the shuttle containing the weft, and the shuttle to pass through the shed of the warp. This right to his left hand between the warp threads so raised and those left at rest. When the weft is so passed through, the raised warp threads are lowered, and the other set raised, the shuttle being then passed through from left to right. This is the most simple idea of plaiting or weaving. If, however, a pattern has to be produced either in plain materials or varied colours, it is necessary, instead of raising
and depressing the whole threads of the warp, in two sets, as above described, to raise only such as are required to develop the various parts of the figure, and this, of course, must be done with great exactness, as the position of every thread tells upon the formation of the pattern. The apparatus of Jacquard is for the purpose of regulating these movements, and its mode of action is as follows: The warp threads are each (as in the common weaving process) passed through a small loop in the lifting thread, so as to be raised by means of the treadles, which act directly upon the lifting bars; these lifting threads (fig. 1, i, i, i, i) are attached to certain wires in the Jacquard apparatus, which form a rigid continuation ending in a hook, which, when nothing interferes, is caught and raised by each upward motion of the lifting bar; thus, A is the lifting bar, and it has five projections (E, E, E, F, G), upon which the hooks of the wires catch when in a straight position, as at B, B, but which miss them if they be thrown out of the perpendicular, as at C, C, C. There are only five of these wires given, to prevent confusion, but practically there must be one for every thread of the warp—that is, one for every thread in the width of the cloth to be woven. Each of the lifting wires passes through a horizontal needle placed at right angles, D, D, D, D, D, which has a loop formed for the purpose, thus, at f (fig. 2). This needle passes freely through an opening in the frame at h, and is so looped on to another rod, g, on the spring-box F, that it moves freely without fear of displacement, and if pushed back into the spring-box, is made to press upon one of the spiral springs E, which restores it to its place as soon as it is freed from pressure. In the diagram (fig. 1), this pressure is supposed to be exerted upon the lifting wires, C, C, C; consequently, if the lifting bar A is simultaneously raised, those three wires are missed, whilst the other two, B, B, being in position, catch the projections k, k on the bar, are drawn up with it, and thus raise the threads of the warp to which they are attached.

Now, the regulation of this pressure upon the horizontal need is effected by a revolving square roller, which has each of its four sides perforated with rows of holes, which, like the needles and lifting wires, correspond in number to the threads of the warp. This roller, when in its place, receives into one row the perforations of the whole row of needles where they project through the frame at h, and it has a motion given by the machinery which brings each row on its four surfaces in regular order into the same position, and if no impediment is offered, all the whole chain of needles, the upright wires lift the entire set of warp threads to which they are attached. But in order to produce the necessary variations of motion required by the pattern, a set of cards are made each of the width of the square roller; these also are so arranged that when placed on the surface of the roller their perforations correspond exactly with those on the roller immediately beneath them; but the cards are perforated in exact accordance with the pattern, so that intervals occur in which there are no perforations to correspond with those on the roller; hence, when the roller L (fig. 1) is brought up to the frame h, some of the needles will find entrance into the holes of the roller through the corresponding perforations in the covering card, seen in section M, fig. 1; but others will be prevented entering by the absence of such perforations, and the card, by the resistance it offers, will force the needles thus opposed back, and the wires, by passing thereby the hooks of the lifting wires from the action of the lifting bar. The cards are looped together at the corners, and move as an endless chain on the rollers, and the entire set of perforations on the whole chain of cards exactly represents the pattern to be produced; the same as the notes represent the air in a piece of music. Of course, the simple operations here described require mechanical arrangements of great nicety to regulate them, and these are so complicated that mere verbal description would hardly help much to explain them; indeed, even with the loom and its apparatus, and its numerous arrangement of hundreds, and even thousands of cards before us, the unpractised eye finds great difficulty in comprehending its movements.

A very wonderful simplification of the Jacquard apparatus was shown in the International Exhibition (1862), by Eugenio Vincenzio of Modena, by which a saving of bulk alone is effected to the extent of two-thirds, and the toil of the artisan is lessened greatly by the corresponding lightness of the parts of the machine which he has to move. The most remarkable part of this new invention is the extreme delicacy of the needle action, so that there is no shock when the card offers resistance, hence the inventor has been enabled to substitute paper for thick cardboard, and can consequently perforate a dozen with the same ease as one, hence the pattern may be repeated without extra labour. This beautiful little loom will certainly displace the ordinary Jacquard, if it is not itself superseded by the wonderful invention of the electric loom by Signior Bonelli, for a description of which see weaving.

Jacquerie (see Jack), the name given to the insurgent peasants in France in the middle of the 14th c., in the reign of John. The insurrection of the J., broke out in the year 1358, when the French king was a prisoner in England, and France in a state of the greatest disorder and anarchy. The immediate occasion of it was the enormities
JACTITATION OF MARRIAGE—JAGGERNAUT.

perpetrated by Charles the Bad, king of Navarre, and his adherents; but it was really caused by long-continued oppression on the part of the nobles. Suddenly rising against their lords, the peasants laid waste several towns in the province, murdered the nobles, and violated their wives and daughters, practising every enormity, and acting, as they said, on the principle of doing as had been done to them. The insurrection broke out in the neighbour-}

Outside the city of Paris, but extended to the banks of the Marne and the Oise. For some weeks this part of France was entirely at their mercy; but the magnitude of the danger induced the quarrrel-}

some nobles to make common cause against them, and on the 9th of June the peasants were defeated with great slaughter near Meaux by Captal de Buch and Gaston Phébus, Count of Foix. This put an end to the insurrection.

JACTITATION OF MARRIAGE is a suit which was formerly competent in the English ecclesiastical courts, and now is competent in the English Divorce Court, to settle a question of disputed marriage. If a party boast or profess that he or she is married to another, the latter may institute the suit and call upon the former to produce proof of the marriage. If this is not done, then a decree passes which enjoins the party to perpetual silence on the subject. This remedy is now scarcely ever resorted to, for, in general, since Lord Hardwicke's Act (1766), there is sufficient certainty in the forms of legal marriage in England to prevent any one being in ignorance whether he or she is really married or not—a reproach which, however, is often made against the law of Scotland. The Scottish law of a declarator of putting to silence, which is equivalent to jactitation of marriage, is often resorted to, the latest and most notorious instance of its use being that in the Telerton marriage case.

JADE, a name somewhat vaguely applied to a number of minerals, not very dissimilar—nephrite, axestone, serpentine, &c. Neaphrite and axestone appear to be the minerals of which Jade ornaments are generally made. But Yt, or Chinese J., of which very beautiful vases and other articles made in China, is supposed to be Prehnite (q.v.). J. of all kinds has a greenish colour, and when polished, has a rather dull and greasy aspect.

JÄN, formerly an independent Moorish king-

dom, is now a province of Spain, forming a portion of the former kingdom of Castile (q. v.). It lies wholly within the basin of the Guadalquivir River, 5184 square miles; pop. 345,879. Conquered by the Moors on their entrance into Spain, it maintained its independence as a Moorish state till 1234, when it fell into the hands of Ferdinand III, and was added to the kingdom of Castile.

JAEN, a city of Spain, capital of the province of the same name, is most picturesquely situated in a mountainous district, at the foot of a rugged castle-crowned hill, on the Rio de Jaen, a tributary of the Guadalquivir, about 50 miles north of Granada. It is surrounded by old Moorish walls, surmounted by numberless towers and pinnacles. Though situated in the midst of plenty, in a fertile neighbourhood, the town is poor. The principal buildings are two cathedrals and several hospitals. Outside the walls are charming well-watered fruit- gardens. Pop. 10,738. In former times, the town was called Japam-graltar, 'Jaen of the Silk,' on account of its silk manufactures, for which it was but not so long famous.

JAFFA. See JOPPA.

JAFFNAPATAM, a seaport in Ceylon, on a}

peninsula at the north extremity of the island, with a pop. of 8000. The place is of Dutch origin, and a large proportion of the population is of Dutch descent.

JAGELLONS. The name of an illustrious dynasty which reigned in Lithuania, Poland, Hungary, and Bohemia. The name is derived from Jagellon, the last of a long line of hereditary grand dukes of Lithuania, who succeeded to his patrimi-}

nial possession in 1386, and was (1386) appointed king of Poland, in which capacity he married the elder daughter of the Hungarian king, of Poland and Hungary, in the former of these kingdoms, after having embraced Christianity, and changed his name to Wladislaus IV. He was married in the whole his life, the attacks of the Teutonic Knights, whom he finally overthrew by the help of the Hussites of Bohemia.

He made an unsuccessful attempt to wrest Hun-

gary from the Emperor Sigismund, founded the university of Cracow in 1490, and died in 1444 at Grodek. His son, Wladislaus V., king of Poland (1434—1444), was also elected king of Hungary on the death of Albert of Austria in 1439, mainly through the assistance of John Hunyady (q.v.). In a war with the Emperor Frederick III., Wladislaus turned his sword against the Turks, drove them repeatedly from Moldavia, Wallachia, and Bulgaria, and returned to his capital of Buda loaded with spoils. His son, Wladislaus VI., succeeded him, and the warlike Wladislaus granted, swearing a solemn oath by the Holy Evangelists; but the pope having, in defiance of all truth and equity, sent Cardinal Cesarini to recognize the treaty with Hungary, Wladislaus from jealousy, rather than a prince sum-

moned to his side John Hunyady, and being joined by Scanderbeg, at the head of an auxiliary force of Epireots, invaded Turkey, but was totally defeated and slain during the whole December, in the year 1444, among the ruins of Julian being also left dead on the field. He was succeeded in Poland by his brother Casimir IV. (1444—1492), whose three sons, John Albert (1492—1501), Alexander (1501—1506), and Sigis-

mund (1506—1544), reigned in succession. Sigis-

mund August (1545—1570), the son of this last, and one of the wisest of the Polish monarchs, added Lithuania to his kingdom, and passed an edict of universal toleration. His sisters, Anna and Barbara, married respectively John of Transylvania, and John III., of Sweden, and the Jagellon dynasty was continued on the Polish throne till 1665.

Wladislaus, the fourth son of Casimir IV., of Poland, was elected king of Bohemia in 1471, on the death of George of Pomerania, and also succeeded Matthias Corvinus in Hungary in 1490. Wladislaus died in 1516, and was succeeded in both kingdoms by his son, Lewis II., who was defeated and slain by the Turks at Mohach (29th August 1526), and upon whose termination the Jagellons of Bohemia and Hungary.

JAGGER. See SKEA.

JAGGENDORF, a small town of Austrian Silesia, is situated on the Oppe, 14 miles north-west of Troppau, has manufactures of cloth, hosiery, and linen. Pop. 6000.

JAGGERNAUT, or JAGGERNAUT PIRL, or PURL, is the name of a town in Ossia (88 54' long, and 19° 45' lat.), celebrated as one of the chief places of pilgrimage in India. It owes its popularity to a water spring called a 'Pahl,' and containing an idol of this Hindu god, called Jaggernaut (commonly Jaggernaut), a corruption of the Sanscrit word Jagannatha, i. e., lord of the world. According to a legend related in the Ayeen Ather.
JAGGERY--JAIL FEVER.

a king desirous of founding a city sent a learned Brahmán to pitch upon a proper spot. The Brahmán, after a long search, arrived upon the banks of the sea, and there saw a crow diving into the water, and, having washed its body, making itself clean in the salt sea. Underestimating the language of the birds, he learned from the crow that if he remained there a short time, he would comprehend the wonders of this land. The king, apprised of this occurrence, built on the spot where the crow had appeared a large city and a place of worship. The Rajah one night heard in a dream a voice saying: 'On a certain day, cast thine eyes on the seashore, when there will arise out of the water a piece of wood 52 inches long, and 1 cubits broad: this is the true form of the deity; take it up, and keep it hidden in thine house seven days; and in whatever shape it shall then appear, place it in the temple, and worship it.' It happened as the Rajah had dreamed, and the image called by him Jagannátha became the object of worship of all ranks of people, and performed many miracles.

According to another legend, the image arising from the water was an avatar or incarnation of Vishnu; it was shined by Vishvanarman, the architect of the gods, into a fourfold idol, which represented the supreme deity, and the temple itself was erected over it, and inaugurated by the god Brahmá and his divine spouse. The present temple was finished in 1196 A.D., under the government of the celebrated Rajah of Orissa, Anang Bhim Deo. Whether the worship of Jagannauté was originally one in honour of Vishnu or not, may be doubtful. The notoriety it has gained is due especially to the fanaticism which induced, and still induces, thousands of Hindu believers to sacrifice their lives, in the hope of obtaining eternal bliss, by throwing themselves under the wheels of the chariot which carries in procession the idol of the god. It is just, however, to state that this practice; take it up, and in former times prevailed to a fearful extent, is greatly abating in our days.

JAGGERY, the name given in the East Indies to the sugar obtained by inquisition from the sap (mera or toddy) of palms. The sap of many species of palm yields jaggery, and probably that of almost all palms must be made to yield it. The coconut yields much of the jaggery of some parts of the East. It is, as generally sold and used in the East Indies, a coarse kind of sugar; chemically, it is the same with cane sugar. The common white, or sugar of raw jaggery, becomes also, by fermentation, palmwine, and from it by distillation arrack is made.

JAGUAR (Felis onca), one of the largest of the cat tribe, and by far the most powerful and dangerous of the American beasts of prey. It is sometimes called the American Tiger. It is nearly equal to the tiger in size; the head is large, the body thick, and the limbs robust; the tail is long, and of equal thickness throughout. The colour varies considerably, but is usually a rich yellow, with large black spots and rings, small black speckles intermingling with them, a mark by which the skin of the J. may be readily distinguished from that of the other large spotted or ringed Felidae. A black or very dark-brown variety occurs, but the characteristic markings may be seen in hair in many cases in the rest of the fur. The J. is strong enough to drag away a horse, and swift enough to capture horses on the open pampas. It is chiefly, however, the inhabitant of forests. It and its allies so much in some districts, that settlements have been deserted on account of the destruction of domestic animals. It climbs trees, however smooth the stem, and moves about with great agility among the branches, making even monkeys its prey. Instances of its attacking man, although they sometimes occur, are not frequent, but it is bold enough to approach enclosures, and even to enter villages in broad daylight, in quest of prey. The J. is often domesticated to chase wild hogs, when it generally at last takes refuge in a tree, and is there shot. The skins of jaguars are exported from South America in great numbers. The J. is found in almost all parts of South America, but its range does not extend north of the Isthmus of Darien. It is called Ounce (Onça) in some parts of South America.

JAHN, JOHANN, a distinguished Roman Catholic orientalist and biblical critic, was born at Taas-witz, in Moravia, June 18, 1750, received his early education at Znaim and Olmütz, and in 1772 entered the Premonstratensian convent of Bruck, where he took his vows in 1774, and was appointed Professor of Oriental Languages and Biblical Criticism. On the suppression of this convent, in 1784, J. was transferred to the same professorship in Olmütz, and finally to the university of Vienna, where he also undertook the chair of Dogmatic Theology. So far as regards the Roman Catholic literature of Germany, J. may be regarded as the father of biblical criticism. But the boldness of some of his opinions having aroused the alarm of the ecclesiastical authorities, he was honourably removed from his chair in the university, by being promoted to a canonry of St Stephen's at Vienna, in 1803. He continued, however, to pursue the same studies with great reputation till his death in 1816, and published many works in both departments, the most important of which, passing over his grammars, lexicons, and elementary books of the Hebrew, Syriac, Chaldaic, and Arabic languages, are his Introduction to the Old Testament, 2 vols. 1792, and again in 4 vols. 1802--1803; Biblical Archæology, 5 vols. 1797--1805, of both which works a compendium appeared in 1804, and again in 1814; a Manual of General Hermeneutics, 1812; an Appendix of Dissertations to this work, 2 vols., in 1813--1815; and an edition of the Hebrew Bible, 4 vols. 1806. Five years after his death, a collection of posthumous Remarks was published at Tübingen, 1821, the genuineness of which, although seemingly without reason, has been called in question. His works have gone through many editions in Germany, and have been translated into several languages.

JAIL FEVER (known also as Putrid or Pestilential Fever) is now considered to be merely a severe form of Typhus Fever (q. v.), and not a distinct disease. At the present time, owing to improved sanitary regulations, this form of disease is almost unknown; but we learn from Howard's
Account of the State of Prisons, that, in his time, the disease was very frequent in the prisons of England, although unknown in those of the continental countries. In the celebrated Black Assizes (1753), held at Oxford in 1577, there is no evidence that the disease prevailed amongst the prisoners, and yet it broke out among the persons present at the trial. It is little more than a century ago (1750) that the lord mayor, two aldermen, two judges, most of the jury, and a large number of spectators, caught this disease from attending the assizes at the Old Bailey; and many of those who were infected died.

JAINAS is the name of a heterodox sect of the Hindus, numerous adherents of which are found in every province of Upper Hindustan, in the cities along the Ganges, and in Calcutta, but more especially to the westward; the provinces of Mewar and Marwar being apparently the cradle of the sect. They are also numerous in Guzerat, in the upper part of the Malabar coast, and are scattered throughout the peninsula. They form a large, and, from their wealth and influence, an important division of the people of India. The teachings of the sect are called a Jina, the latter being one of the denominations of their deified saints; and as another name of these saints is Arhat, their followers are also called Arhatas.

The founders of the J. or Arhatas are in several respects analogous to those of the Buddhists (see Buddha), but they resemble in others those of the Brahmanical Hindus. With the Buddhists, they share in the denial of the divine origin and authority of the Vedas. The Vedic deities; whom they consider superior to the other beings of their pantheon. They differ, indeed, from them in regard to the history of these personages, but the original notion which prevails in this worship is the same. They do not pay special homage to them, and as they disregard completely all those Brahmanical rites which involve the destruction of animal life. It deserves notice, too, that though regarded as a rule the authority of the Vedas, they admit it, and quote the Vedie texts, if the doctrines of the latter are conformable to the Jaina tenets.

According to their doctrine, all objects, material or abstract, are arranged under nine categories, called Tattvas, truths or principles, of which we need notice only the ninth and last, called Moksha, or liberation of the vital spirit from the bonds of action—i.e., final emancipation. In reference to it, the J. not only affirm that there is such a state, but they define the size of the emancipated soul, the place where they live, their tangible qualities, the duration of their existence, the distance at which they are from one another, their parts, natures, and numbers. Final emancipation is only obtained in the state of manhood (not in that of a good demon or brute), while in possession of five senses, while possessing a body capable of voluntary motion, in a condition of possibility, while possessing a mind, the same as the principle of the highest asceticism, in that path of rectitude, in which there is no retrogression, through the possession of perfect knowledge and vision, and in the practice of asceticism. Those who attain to final liberation do not return to a worldly state, and there is no interruption to their bliss. They have perfect vision and knowledge, and do not depend on works. See J. Stevenson, The Kalpa Sihtra, and Nora Tatvaa.

The principles of faith, as mentioned before, are common to all classes of J., but some differences occur in the practice of their duties, as they are divided into religious and lay orders, Jata and Svetambaras. Both, of course, must place implicit belief in the doctrines of their saints; but the J. has to lead a life of abstinence, tacity, and continence; he should wear a thin cloth over his mouth, to prevent insects from flying into it, and he who has personal objects present must place on which he is about to sit, to remove any living creature out of the way of danger; but, in turn, he may dispense with all acts of worship; whilst the Svetambar has to add to the observance of the religious and moral duties the personal worship of the saints, and a profound reverence for his more pious brethren. The secular Jains must, like the ascetic, practise the four virtues—liberality, gentleness, pietv, and penance; he must govern his mind, tongue, and acts; abstain, at certain seasons, from salt, flowers, green fruits, roots, honey, grapes, tobacco; drink water three strained, and never leave a liquid uncovered; lest an insect should be drowned in it; it is his duty also to see that the living images of the sect are washed, and the images of the Jaina saints are placed, walk round them three times, make an obeisance to the image, and make some offerings of fruits or flowers, while pronouncing the usual formula as 'Salutation to the Survivors, to the Parityans, to the Sage, and to the Teachers, to all the Devout in the world.'

The reader in a Jaina temple is a Yat, but the ministrant priest is not seldom a Brahman, since the J. have no priests of their own, and the presence of such Brahmanical ministrants seems to have introduced several innovations in their worship. In Upper India, the ritual in use is often intermixed with formulas belonging more properly to the Hindu, but the Svetambaras, (see Hindu Sects under India), and images of Siva and Sakti, are the species of worship observed, and their consort take their place in Jain temples. In the south of India, they appear, as mentioned before, to observe also all the essential rites of Sanskaras of the Brahmanical Hindus. The festivals of the J. are especially those relating to events in the life of their deified saints; but they observe also several common to other Hindus, as the spring festival, the Vratyam, and others.

The J. are divided into two principal divisions, Digambaras and Svetambaras. The former word means 'sky-clad,' or naked, but in the present day, ascetics of this division wear coloured garments, and confine the use of white linen to the most sacred parts of their dress. Svetambaras means 'one who wears white garments,' but the points of difference between these two divisions are far from being restricted to that of dress: it is said to comprehend a list of 700 topics, of which 54 are considered to be paramount importance. Amongst the latter are mentioned the practice of the Svetambaras to decorate the images of their saints with earrings, necklaces, armlets, and tiaras of gold and jewels; whereas the Digambaras leave their images without ornaments. Again, the Svetambaras assert that there are twelve heavens and sixty-four Indras; whereas the Digambaras maintain that there are sixteen heavens and one hundred Indras. In the south of India, the J. are divided into two castes; in Upper Hindustan, they are all of one caste. It is remarkable, however, that amongst themselves they recognise a number of families between which no intermarriage can take place, and that they resemble, in this respect also, the ancient Brahmanical Hindus, who established similar restrictions in their religious codes.

As regards the pantheon of the Jaina creed, it is still more fantastical than that of the Brahmanical sects, whence it is borrowed to a great extent.
but without any of the poetical and philosophical interest which inheres in the gods of the Vedic time. The highest rank among their number and hosts of divine beings — divided by them into four classes, with various subdivisions — they assign to the deified saints, which they call Jina, or Arhat, or Tirthakara, besides a variety of other generic names. The J. enumerate twenty-four Tirthakaras of their present age, twenty-four of the present, and twenty-four of the age to come; and they invest these holy personages with thirty-six superhuman attributes of the most extravagant character. Notwithstanding the sameness of these attributes, they distinguish the twenty-four Jinas of the present age from each other in colour, stature, and longevity. Two of them are red, two white, two blue, two black; the rest are of a golden hue, or a yellowish brown. The other two peculiarities are regulated by them with equal precision, and according to a system of decreement, from Rishabha, the first Jina, who was 500 poles in stature, and lived 8,400,000 great years, down to Mahâdeva, the 24th, who had degenerated to the size of a man, and was no more than 40 years on earth; the age of his predecessor, Parsvanâtha, not exceeding one hundred years. The present worship is almost restricted to the two last Tirthakaras; and as the stature and years of these personages have a reasonable possibility, H. T. Colebrooke inferred that they alone are to be considered as historical personages. As, moreover, no one of the disciples of the Buddha there is one, Indrabhuti, who is called Gautama, and as Gautama is also a name of the founder of the Buddhist faith, the same distinguished scholar concluded that, if the identity between these names could be ascertained, it would lead to a further surprise that both these sects are branches of the same stock. But against this view, which would assign to the Jaina religion an antiquity even higher than 543 before Christ — the date which is commonly ascribed to the apostheosis of Gautama Buddha— several reasons are alleged by Professor Wilson. As to the real date, however, of the origin of the Jaina faith, as the same scholar justly observes, it is immersed in the same obscurity which invests all remote history amongst the Hindus. We can only infer from the existing Jaina literature, and from the doctrines it inculcates, that it came later into existence than the Buddhist sect. — The best essays on the Jaina mythology, observations on the literature of this sect are those by Colebrooke in his Miscellaneous Essays, and by Wilson in the first volume of his works (London, 1862).

JAKUTSK (Takotok), chief town of the territory of that name in Eastern Siberia (see Siberia). It is situated on the left bank of the river Lena, lat. 62° 1’ N., long. 119° 44’ E.; distance from St. Petersburg, 5751 miles; pop. in 1858, 3460 inhabitants. The whole industry of the town consists in candle-works, but it is, notwithstanding, the principal market of Eastern Siberia for traffic with the native hunting tribes of the Jakuta and Buriat. The former, mostly nomadic tribes, possessing large herds of cattle and horses, bring butter to the market, which is of the dried, and salted kind. The periods of the year are the months of May and June; in the former, the goods are despatched to the savants; in the latter, an important fair takes place annually, during which the quantity of merchandise sold, chiefly furs and manufactory goods, amounts to £50,000 in value. Manufactured goods, hardware, &c., are brought from Irkutsk by the Lena, and the passage, about 2200 miles, requires a whole month of navigation.

JALAP, a well-known purgative medicine, is the root of Eucosmus Purgans, a plant of the natural order Convolvulaceae. It is found in Mexico, at an elevation of about 6000 feet above the level of the sea, in the neighbourhood of the town of Jalapa or Xalapa, from which the name jalap is derived. It is a perennial twinering plant, with large flowers and a turnip-like root, varying from the size of a hazel-nut to that of a man's fist. The roots when fresh are white and fleshy, and abound in a milky juice. They are prepared for the market by drying.

Jalap was long erroneously referred to other plants, amongst others to Mirabilis Jalapa, known in our flower-gardens as Maravel of Peru. — The root known as Male Jalap or In Jalap, with which the true jalap of commerce is often adulterated, was recently declared by Mr Hartweg to be Ipomoea batatas. Its properties are somewhat similar to those of true jalap, but it is very inferior.

Jalap seems to have been first introduced into this country as a medicine about 1669.

The dried roots are brown and wrinkled externally, and of a deep yellowish-gray colour internally; their odour is faint and disagreeable, and their taste is nauseous. The active ingredient is the resinous portion, which varies from about 10 to nearly 20 per cent, and which is composed of two distinct substances, Jalapine (C₁₆H₂₄O₂) and Jalapic acid. Jalap resin may be distinguished from common resin by its insolubility in volatile oils. Jalap is a valuable cathartic, but is seldom given alone. Its purgative action is increased by the addition of a little calomel, and its hydrogogue action by bitartrate of potash, while its tendency to produce griping is obviated by the addition of a little ginger. It is extremely useful in those febrile affections of children which are associated with constipation; and in diseases of the brain it is a good purgative to select, in consequence of its derivative action. In the form of Compound Jalap Powder, which consists of one part of powdered jalap, two parts of bitartrate of potash, and a little ginger, it is of great service in some kinds of dropsy, in consequence of its hydrogogue action.
JALAPA—JAMAICA.

The ordinary dose of powdered jalap for an adult varies from ten to thirty grains, a scruple generally acting smartly and safely; for children under a year the dose is from two to five grains. The dose of the compound powder is double that of the ordinary powder. The *Tincture of Jalap*, in the dose of one or two drachms, is a useful addition to the ordinary black-draught when it is desired to increase its activity.

JALAPA, a city in the Mexican confederation, is second in importance among the towns of the state of Vera Cruz. It is on the grand route between the capital of the country and the seaport of Vera Cruz, and is about 60 miles west-north-west from the latter. Situated at an elevation of 4335 feet above the level of the sea, its climate may be said to be that of the temperate region, and it is a favourite resort of the invalids of the coast. Pop. about 10,000.

JAMAICA, aboriginally Xaymaca, or Land of Wood and Water, one of the West India Islands, and by far the most important of those belonging to the British Empire, is about 90 miles to the south of Cuba, and stretches in N. lat. between 17° 40' and 18° 30', and in W. long. between 76° 15' and 78° 25'. Area, 6400 square miles (rather more than that of Yorkshire); greatest length, 300 miles; greatest breadth, 50 miles. It is traversed from east to west by a heavily timbered ridge, called the Blue Mountains, which rises to about 7000 feet. From this range, at least 70 streams descend to the north and south shores but owing to the shortness and delictivity of their courses they are not navigable, with the exception of one, the Black River, which affords, for small craft, a passage into the interior for 30 miles. Excellent harbours are everywhere to be found. But incomparably the best of these is formed by a deep and capacious basin in the south-east quarter of the island, which washes the most spacious and fertile of the plains between the hill-country and the coast. Around this inlet, and within a few miles of each other, are all the considerable centres of population, Port Royal, Kingston, and Spanish Town. The soil and climate are so genial, that coffee-plantations are found at an altitude of 300 feet above the sea level.

The climate varies considerably—the torrid belt of the coast gradually passing into the temperate region of the central heights. The latter is said to be remarkably favourable to longevity; and, as long as been a retreat for the resident themselves, it has lately begun to attract invalids from the United States. To contrast two positions—the one near Kingston Harbour, and the other at the intermediate elevation of 4000 feet—their annual means are stated to be respectively 81° F. and 68° F. The rainfall appears to differ widely in different years, ranging from about 60 to upwards of 120 inches—the consecutive years of 1835 and 1836 having given 122-12 and 361-13. Hurricanes are understood to be both less frequent and less violent than in most other parts of the archipelago—a particular ascribed, in some measure, to the shelter afforded by the larger islands of Hayti and Cuba. Should the more common occasions of occurrence from two to five days; occurred, one of them, in 1692, having almost overwhelmed Port Royal.

J. was discovered by Columbus during his second voyage in 1494, and was taken possession of by the Spaniards in 1509. So great were the inhumanity of the conquerors, that 50 years after the Spanish invasion of the island the native population is said to have entirely disappeared. On May 3, 1655, a British expedition, sent out by Oliver Cromwell, under Admirals Penn and Venables, seized and captured the island, which was formally ceded to England by the treaty of Madrid in 1670. During the 160 years of Spanish colonisation, the inhabitants, including Africans and Europeans, had not attained the number of 3000. Within about the same period of English rule (from 1655 to 1801), the estimated census showed 540,000—30,000 whites, 10,000 free people of colour, and 200,000 slaves. In 1861, the total population amounted to 378,433, of whom 13,816 were whites, and the remainder half-breeds or blacks. But in J., as in the British colonies at large, the distinction between the two races is now merely physical. Even as early as 1833, freeholders of colour received the elective franchise; and, subsequently to 1838, they became themselves qualified to sit in the local legislature—a qualification which, by 1853, had placed one of them in the council, and fifteen in the assembly. On the productiveness and trade, however, of the island, emancipation has undeniably had an unfavourable effect. But, even previously to the new order of things, the commercial crops were decreasing.

To take by itself the grand staple of sugar, the last 3 years of the slave-trade, 1805—1807, had averaged fully 144,000 headships; the 4 years before the commencement of the abolition of slavery, 1816—1834, under 91,000, the greatest annual average, 1835—1838, nearly 70,000; and the first 4 years of perfect freedom, 1839—1842, less than 42,000. According to the returns of 1834 and 1860, the principal exports—making allowance for the export for a growing consumption on the spot—were as follow:—

<table>

Among the other productions of the island are ginger, logwood, mahogany, cocoa-nuts, arrowroot, &c. Indigo, once widely cultivated, is now neglected. But while the exports have diminished, the imports, more particularly food, have increased.

In 1860, the imports and the exports were valued, respectively, at £2,922,855 and £1,225,577. In 1860, 1001 vessels, of 127,933 tons, entered and cleared the ports. In the same year, the revenue amounted to £262,239, and the expenditure to £255,239.

Politically, J. includes the Caymanas to the northwest, while, to the north-east, the Turk's Islands, the most southerly portion, in fact, of the Bahamas, form a separate dependency. The constitution is somewhat peculiar. In addition to the royal governor and a popular assembly of 47 members, there is a council, partly legislative and partly executive, of 12 nominees of the crown. Both for constitutional and civil purposes, there is a primiary qualification, of which, in either case, one phase is the payment of direct taxes—£10 a year qualifying for a representative, and £3 for a constiuent.

J. embraces two sects of the Established Church of England, the former of which is that of the Church of England, which here approaches more nearly to the condition of an establishment than is usual in colonies, has a bishop, whose diocese embraces British Honduras and the Bahamas, with a regular staff of parochial clergy and besides Presbyterians, Methodists, Baptists.
and other Protestant bodies, Roman Catholics are numerous, and Jews still more so.

After being 200 years in the possession of Britain, the capabilities of J. are still very inadequately developed. To say nothing of the improvement and extension of its existing agriculture, it possesses almost virgin sources of wealth and plenty in its pastures and its fisheries. Instead of buying, as it does, a large share of its means of subsistence, it may either supply the same to others, or maintain twice or thrice its present population.

JAMES (Gr. Iacubos, and really the same word as Jacob) is the name borne by two or three persons in the New Testament. These are James the son of Zebedee, and James the brother or cousin of our Lord, who is considered by many to be the same as James the son of Alphaeus. James the son of Zebedee, surnamed the Elder, was the brother of the apostle John, and believed the call to the apostleship was a fisherman. After the ascension of Christ, he seems to have remained at Jerusalem, and was the first of the apostles to suffer martyrdom, being slain by Herod Agrippa, 44 A.D.

The legend of his having planted the gospel in Spain, and he being the patron saint of that country—James the brother or cousin of our Lord, surnamed the Less, the other apostle of this name, appears to have founded, like his brother the Elder, chiefly in Jerusalem. From the glimpses of which are obtained in the Acts of the Apostles and the Epistle to the Galatians, it is clear that he presided over the mother-church of Jerusalem. According to the tradition recorded by Hegesippus (who flourished about the middle of the 2d c.), he was considered a miracle of righteousness, even by the unbelieving Jews, who gave him the name of Just. The cunning of the more bigoted Jews, however, procured his condemnation, and the high-priest Annas gave order that he should be stoned to death. According to Josephus, the execution of the sentence excited great dissatisfaction among the people of Jerusalem. The date of his death cannot be precisely fixed, but it was probably about 62 or 63 A.D.

THE EPITOME GENERAL OF JAMES is regarded by most theologians as a composition of his. The primitive church, however, placed it sometimes among the apocrypha (or scriptures of doubtful genuineness), and sometimes even among the apotheos (or apocryphal scriptures). In the 4th c., its authority increased; and the Council of Carthage (397 A.D.) pronounced it canonical. This, of course, did not settle the question of its authenticity; and at the period of the Reformation, both its authenticity and religious teaching were attacked by Erasmus and Cajetan (in the Roman Catholic Church), by Lucar (in the Greek Church), and by Luther, who called it "a downright straggly epistle." It is the superior culture, conducted Alford's Greek Test. vol. 4 (Lond. 1859).

JAMES I., king of Scotland (1406—1437), was the second son of Robert III., by Annabella Drummond, daughter of Sir John Drummond of Stobo Hall. His older brother, the Duke of Rothesay, having been murdered by his uncle, the Duke of Albany, J. became heir to the throne. Fearing that he also might be sacrificed to the unscrupulous ambition of Albany, his father resolved to send him to France. Accordingly, in 1405, he set sail for that country, but he never reached it; the vessel in which he was embarked having been taken by the English. J. himself was numbered among the crew of the clothes, stowed in the tower. In 1407, he was removed to Nottingham Castle. In 1417, he accompanied Henry V. in his expedition to France. On the death of Robert III., in 1406, the government devolved on the Duke of Albany. On his death, in 1419, his son James succeeded to the regency. In 1424, J.'s long captivity came to an end: on giving hostages for payment of £40,000, he was allowed to return to his kingdom. Previous to leaving England, he married Johanna, daughter of the Earl of Somerset; fourth son of John of Gaunt. To the excellent education which he had received in England, J. was indebted for the development of his very considerable powers of mind. His poems, Christ's Kirk on the Green (or of the village of authentic poetry, but disputed), and King's Quair, shew him to have been possessed of high poetic talent. With the acts of his first parliament, in 1424, the regular series of Scotch statutes began. Subjects of ecclesiastical, criminal, civil, and military laws were passed for the regulation of trade, and for the internal economy of the kingdom; while these were followed up by an executive vigour which Scotland had never before known. No sooner did J. feel himself the monarch, than he resolved to execute vengeance on the Albany family. By a parliament held at Perth in 1425, the two sons of the late Regent Murdoch, and his father-in-law, the Earl of Lenox, were found guilty of treason, and immediately beheaded. The next few years of J.'s reign are among the most really peaceful in the history of Scotland previous to the union of the crowns; the whole efforts of the king being directed to the depression of the internal disorders of the kingdom, especially of the Highlands, where scarcely any law except that of the strongest had hitherto been known. In 1436, J.'s eldest daughter, Margaret, was married to the Dauphin of France, afterwards Louis XI. Amongst those whom the widely severe policy of the king had offended was Sir Robert Graham, uncle of the Earl of Strathearn. He had been imprisoned in 1425, on the impeachment of the Albany family. Owing to this cause, or to some real or imaginary injury done to his family, Graham was so irritated, that in 1435 he actually used treasonable language to the king himself when presiding in parliament. For this he was banished, and his possessions declared forfeited. He retired to the Highlands, to brood over a plan of revenge, which circumstances soon put it into his power to execute. In 1437, the court held the Christmas festival at Perth. The king was about to retire for the night, when the sound of men in armour was heard outside the gates. It was Graham, accompanied by 300 armed men. The looks of the chamber-door having been purposely spoiled, Catherine Douglas, with a spirit worthy of her name, thrust her arm into the staple, to make it serve the purpose of a bar; but her arm was broken, and the ruffians entered the chamber. The king, who had hidden himself in an aperture under the floor, was discovered, dragged out, and cruelly murdered, in the 44th year of his age. Graham and the other ringleaders were afterwards seized, tortured, and put to death. J. was unquestionably the most able of the Stuart family. Both
his intellectual and practical ability were of a very high order.

JAMES II., king of Scotland (1437—1460), was the son of James I. and Queen Joanna, and was born in 1430. He was crowned at Edinburgh when only in the sixth year of his age. Sir William Crichton, the Chancellor, and Sir Alexander Livingston, contrived to keep possession of the person of the young king, and consequently to wield the royal authority until he had reached his fourteenth year. The power of the House of Douglas had now risen to such a height as almost to overshadow that of the crown. In the hope of curbing it, Crichton had treacherously caused William, the young earl, and his brother to be put to death. The policy of the act proved to be as bad as its spirit, for by the marriage of the heiress of the murdered youth with her cousin, the family was restored to more than its former power. The young king, tired of the rule of Crichton, put himself under the protection of the young Douglas. A parliament was held, by which Crichton and Livingston were declared rebels and their estates forfeited. Under the rule of the earl, the kingdom fell into complete anarchy, and became one scene of violence and disorder. Douglas heartily shared the disrepute of renown of his House; in 1448, the English having invaded Scotland, he gave them battle on the banks of the little river Sark, in Annandale, and defeated them with very considerable slaughter. In 1449, J. married Mary, daughter of Arnold, Duke of Gelderland. The character of the king appears to have been much strengthened after his marriage. Like most of the Stuarts, he possessed great animal courage; he seems also to have possessed much of his father's charm of perception in framing laws, and of his energy in enforcing their observation. Chafing under the sway of Douglas, he resolved to assert his independence. Crichton, who had previously contrived to make terms for himself, was compelled to resign his office. Douglas, driven from power, formed an alliance with the Earl of Crawford. By the union of these two powerful nobles, it seemed that the royal authority in Scotland had virtually become extinct. J. had recourse to treachery as an invited Douglas to visit him at Stirling Castle, where, picking a quarrel with him, he murdered the earl with his own hand. But the power of the Douglas family was not yet broken. Though the Earl of York, then dominant in England, and by the martial influence of his name, the heir of the murdered earl was enabled to raise the standard of rebellion at the head of an army of 40,000 men. But J., listening to the wise advice of his councillor Keenened, soon succeeded in quelling this insurrection. Douglas was compelled to flee; and his lands were granted to the Earl of Angus. In 1460, from causes not clearly known, J. infringed an existing truce with England, by laying siege to the castle of Roxburgh, then in the hands of the English. While he was standing beside one of the rudely made cannons of that time, the gun burst, and a fragment striking him, produced almost immediate death. He died in the 29th year of his age, and 24th of his reign.

JAMES III., king of Scotland (1460—1488), was the son of James II. and Mary of Gelderland, and was born in 1453. On the death of his father, the government appears to have been conducted by his mother, guided by the wisdom of Bishop Keenened, the heir of the latter in 1460, the young king fell into the hands of Lord Boyd and his family. In 1467, so great influence had they acquired, that J. gave his sister in marriage to Sir Thomas Boyd, son of Lord Robert. Sir Thomas being at the same time created Earl of Arran. On the king's marriage, however, in 1469, with Margaret of Denmark, power changed hands; Sir Boyd was obliged to retire, and then Arran was driven into exile; in which condition he died. In 1474, his widow married Lord Hamilton; of which marriage were born James, created Earl of Arran, and Elizabeth, who married Matthew, Earl of Lennox. J. was most happy under the influence of favourites. Conspicuous among these was a man named Cochran, originally a mason. Through his means, the Duke of Albany, brother of J., was forced to flee from the kingdom, having been charged with witchcraft; while the Earl of Mar, also a brother of the king's, was actually put to death on the same absurd accusation. The rule of Cochran and other low-born favourites became intolerable to the haughty Scotch nobility. Disputes having arisen with England, and an English force having advanced on Berwick, J. put himself at the head of an army to oppose the invaders. Angus, Crawford, Argyie, and others resolved to intrude to the foot of the army to rail the king to the obvious favourite. They met in council to deliberate upon their plans. It was on this occasion that Angus acquired his well-known sobriquet of 'Bell the Cat.' The result was, that Cochran and all the leading favourites were arrested and summarily hanged. The king himself was imprisoned within the castle of Edinburgil. The banished Duke of Albany had joined the English army. On a treaty being made, he was, by some unknown means, permitted to return to his brother's favour; he did not long hold it, however. In 1487, Margaret of Denmark died. J.'s love of pursuits which, for the age in which he lived, were intellectual, brought upon him the contempt of a warlike and biliterate nobility—a contempt on which the weakness of his moral character imposed no check. A conspiracy, whose origin is obscure, ended in a rebellion, having for its avowed object the dethronement of the king. Many of the peers, however, remained true to their king; so that J. was enabled to put himself at the head of a considerable force. But, mainly through the cowardice of the king, the royal army was defeated at Stude, 14th June 1488. J. escaped from the field on the death of his brother's favourites, and the murderers of his mother, and remained a fugitive until the death of his brother. He died at the age of 36.

JAMES IV., king of Scotland (1488—1513), was the son of James III. and Margaret of Denmark, and was born March 17, 1472. A movement, headed by the Earl of Lennox, having for its object the subversion of the new government, was soon quelled; and the rule of the young king gave promise of being both vigorous and popular. The aversion of the preceding reign was followed by a profusion which conciliated the nobles; while the king's personal beauty and open manner won the hearts of the people. The naval exploits of Sir Andrew Wood of Largo, in the beginning of this reign, were a source of note. With the great naval force, he twice defeated the English; on one occasion, capturing as many as five of their ships of war. Instead of avenging this defeat by force of arms, Henry VII., then reigning in England, wisely resolved to endeavour to win Scotland by concilia- tion and policy. He proposed a marriage between J. and his daughter Margaret; but his wise schemes were for a long time frustrated by the gold and intrigue of the king of France. But at length the influence of Henry prevailed, and in 1503, J. married Margaret of England. By a treaty then entered into between England and Scotland, the first peace since 1332 was established between the two countries.
The king of England saw what none of his predecessors had been able to see—that he could easily gain by policy what it was hopeless to attempt by force. Had he lived longer, a lasting amity might have been established between the two countries; but his son and successor was even hotter and more headstrong than J. himself. The English treaty was followed by a period of almost unexampled anarchy. J. died by the death of Henry VII., in 1509, all this fair prospect was destroyed. It was not, however, until Henry VIII. had been two years on the throne that a rupture took place between the two kings. J. had demanded reparation of an alleged outrage on the British flag; Henry had returned a contemptuous answer. He had further irritated the Scotch king by countenancing certain English border chieftains who had been necessary to the murder of Sir Robert Ker; he had also declined to deliver a legacy of jewels bequeathed to Queen Margaret by her father. Long and angry negotiations followed, which ended in James's rash and fatal invasion of England in the summer of 1513. The disaster was complete. Flodden (q.v.), the 9th September of that year, the body of James was found on the field after the battle. He died in the 41st year of his age, and 26th of his reign.

JAMES V., king of Scotland (1513-1542), was the son of James IV. and Margaret of England. He was born at Linlithgow, 10th April 1512. The period of his long minority is one of the gloomiest in Scottish history. Such was the lawless state of the country, that it was impossible to pass the year without some accident to these companies. The Duke of Albany was chosen regent by the parliament, but his government was almost powerless, owing chiefly to the jealousy and enmity of the leading families. The crown, however, was restored in 1524, and the king, being about 15 years old, was married to Magdalen, daughter of Francis I. This amiable queen lived for but a few weeks; and in the same year, J. was again married. His stepmother soon procured that he should be married to the much younger Duke of Guise. Henry VIII. having declared his independence of the Pope, became desirous that his nephew should follow his example; but J. remained true to his ancestral faith. The king had two sons by Mary of Guise, but they both died in infancy, within a few days of each other—an event which seems to have greatly affected the mind of J. With the view of gaining his nephew over to his ecclesiastical views, Henry proposed that they should have an interview at York. He actually went to that city, and remained in it for six days, expecting the arrival of J., who never came. This piece of real or fancied neglect greatly enraged Henry. In 1542, the English having made an incursion into Scotland, were attacked and defeated with great loss by the Earls of Huntly and Home. To avenge this defeat, Henry sent the Duke of Norfolk into Scotland with an army of 20,000 men. To avoid this invasion, J. raised an army of 30,000 men to oppose Norfolk. The spread of the Reformation had now begun to divide the kingdom; the nobles being mostly on the reformed side, who, the king sided with the clergy. When the Scottish army had reached Fala, news arrived of Norfolk's retreat. The nobles, actuated either by disloyalty, or by hopes of Flodden, declined to follow the king in an invasion of England, upon which he was bent. While this controversy was pending between the nobles, and the clergy, a rumour arose that Oliver Sinclair, a royal favourite, had been appointed to the chief command. The army became a scene of tumult and disorder. While in this disgrace, it was attacked by Daer and M'grave, two English leaders, at the head of 300 men. The Scotch were utterly routed. This dishonour to his arms seems quite to have broken the heart of James. He shut himself up in Falkland Palace, where he died, December 13, 1542, seven weeks after the birth of his unfortunate daughter Mary, in the 31st year of his age, and 30th of his reign.
JAMES II.—JAMES.

upon him, and in 1613 he was created Earl of Somerset. In his turn, Somerset gave place to Buckingham. Under these minions, the name and power of England, so formidable under Elizabeth, sunk to insignificance. In 1617, J. revisited Scotland; a visit which his angry disputes with the clergy did not give him much leisure to enjoy. In 1619, his eldest son, Henry, Prince of Wales, died, to the great grief of the nation. J. had set his heart upon effecting a marriage between his son Charles (now Prince of Wales) and a Spanish princess. For some time, it seemed as if his design would succeed; and in 1623, Charles actually went to the court of Spain, along with Buckingham, to prosecute his suit. Buckingham, however, having quarrelled with the leading men of the Spanish court, returned to England, and was pique. A war with Spain was the result. J. died on 27th March 1625. He was aptly termed by Sully 'the wisest fool in Christendom.' 'He was indeed,' says Macaulay, 'made up of two men—a witty, well-read scholar, who wrote, disputed, and harangued, and a nervous, drivelling idiot who acted.' His reign is interesting to the student of English constitutional history, as it was during it that the Great Law of the Realm may be said to have taken its first decided stand in its long contest with the crown. The parliament of 1621 is especially memorable on this account.

JAMES II. OF ENGLAND AND VII. OF SCOTLAND (1668—1688), son of Charles I. and Henrietta Maria, was born at Rouen, 24th October 1633, he was created Duke of York. In 1648, during the civil war, he made his escape to France. For some time he served in the French army under Turenne; but on peace being made with Cromwell, he was obliged to leave both the army and territory of Louis XIV. He then entered into the military service of Spain. At the Restoration, he was made Lord High Admiral of England, twice commanding the English fleet in the Channel wars with the Dutch. In 1660, he married Anne, daughter of Lord Chancellor Hyde. On the death of the Duchess of York in 1671, J. avowed his conversion to popery. On the passing of the Test Act in 1673, he was obliged to resign office. On the 21st November 1673, he married Mary Beatrice, daughter of the Duke of Modena. During the great irritation against the Roman Catholics which arose in England on the publication of Titus Oates's supposed discoveries, the Duke of York was for a short while on the continent. The bill for his exclusion from the throne was twice read before the House of Commons, and only prevented from passing by the prorogation of parliament, 28th May 1679. In 1689, the Exclusion Bill passed again the House of Commons, but was rejected in the House of Lords. On his return from abroad, and while the Exclusion Bill was before parliament, the duke was sent down to govern Scotland. On the death of Charles II., 6th February 1685, J. succeeded to the crown without opposition. He had scarcely been many hours a king when he violated the fundamental laws of the constitution by continuing the levy of customs, settled on the late king, for life only, without the authority of parliament. At war with his parliament, in order to obtain money, J. was forced to become the pensioner of Louis XIV. In Passion Week 1685, the rites of the Church of Rome were openly celebrated at Westminster with full splendour. In the same year, the suppression of the Duke of Monmouth’s rebellion in England, and that of the Earl of Argyll in Scotland, was followed by great severities. On the_later circuit alone, well known as the Bloody Assizes, presided over by the infamous Jeffreys, 320 persons were hanged. On the meeting of parliament on the 9th November of the year, J. requested extra supplies to maintain his favourite scheme of his. He noticed in his speech, that in some recent appoint- ments he had thought fit to dispense with the Test Act. After a stormy debate, government was finally beaten on the question if his design would succeed; and in 1623, Charles actually went to the court of Spain, along with Buckingham, to prosecute his suit. Buckingham, however, having quarrelled with the leading men of the Spanish court, returned to England, and was pique. A war with Spain was the result. J. died on 27th March 1625. He was aptly termed by Sully 'the wisest fool in Christendom.' 'He was indeed,' says Macaulay, 'made up of two men—a witty, well-read scholar, who wrote, disputed, and harangued, and a nervous, drivelling idiot who acted.' His reign is interesting to the student of English constitutional history, as it was during it that the Great Law of the Realm may be said to have taken its first decided stand in its long contest with the crown. The parliament of 1621 is especially memorable on this account.

JAMES II. OF ENGLAND AND VII. OF SCOTLAND (1668—1688), son of Charles I. and Henrietta Maria, was born at Rouen, 24th October 1633, he was created Duke of York. In 1648, during the civil war, he made his escape to France. 'His reign is interesting to the student of English constitutional history, as it was during it that the Great Law of the Realm may be said to have taken its first decided stand in its long contest with the crown. The parliament of 1621 is especially memorable on this account.'
JAMES—JAMESON.

some poetry, and several historical works of a biographical kind, such as Charlemagne, The Black Prince, and Richard Cœur de Lion. J.'s writings are cheerful and pleasant in spirit, and his notions of the romantic, whether in scenery or character, are entirely conventional, and are apt to make quick-witted readers smile at the juvenility of the author's fancy.

JAMES, John Angel, an eminent Congregational minister, was born at Blandford, Dorsetshire, June 6, 1735, studied for a short time at a dissenting college at Gosport, and was placed on the "preaching list at seventeen." He was highly popular, and when only twenty, was settled as pastor of the "church meeting in Carr's Lane," Birmingham, where he remained till his death, 1st October 1859. In the course of years, Angel James came to be considered the most important and influential public man in connection with his own denomination, and on account of his "evangelical" views of religion, he was also much esteemed both by the Low-Church party in the English Establishment, and by dissenters generally in Scotland and America. He published a multitude of sermons, treatises, tracts, and medical volumes (the best known being the Anxious Inquirer), which had—and some of them still have—a vast circulation. See Dale's Life and Letters of John Angel James (Lond. 1829).

JAMES RIVER, an important river of North America, formed by the union of the Jackson and Powhatan streams, rises near the middle of Virginia, and has its entire course in that state. It flows in an east-south-east direction, passing Lynchburg, and falls at Richmond; and is an estuary for the last 60 miles of its course, it falls into the Atlantic at the southern extremity of Chesapeake Bay. It is 450 miles in length, and navigable to Richmond, 150 miles from its mouth. Its chief tributaries are the Appomattox on the right, and the Chickahominy on the left bank, made historical by the battles of 1862. It was at Jamestown, 32 miles from the mouth of this river, that the first English settlement in America was formed, 1607. By the James River and Hanover Canal, which extends westward along the upper course of the river, from Richmond to beyond the Blue Ridge, the navigation of the James is carried into the centre of Virginia.

JAMES TOWN, the chief place and only seaport of St. Helena (q.v.).

JAMESTOWN, a village in New York, United States of America, 38 miles south-west of Buffalo, on Chautauqua Lake, and near Lake Erie. It has a large trade and considerable manufactures. Pop. in 1890, 8811.

JAMES'S BAY, a southerly arm of Hudson's Bay, extends in lat. from 51½ to 57° N., and in long. from 79° to 82° 30' W. It is so beset with islands, that its navigation is more dangerous than that of the other divisions of the same inland sea. Near its southern extremity is situated Moose Factory, the seat of the factory, and a part of the York Factory, of the Hudson's Bay Company on the coast.

JAMES'S PALACE, Sr, a large ineluting brick structure, fronting towards Pall Mall, succeeded Whitehall as the London residence of the British sovereigns, and remained as such from William III. to Victoria. It was reconstructed and made a manor by Henry VIII, having before been a hospital dedicated to St James: Henry also annexed to it a park, which he enclosed with a brick wall, to connect St James's with Whitehall, the then royal residence. Additions and improvements gradually made, totally changed the original palace, so that at the present time little, if any, of the old structure remains. In 1837, the royal household was transferred to Buckingham Palace, but St James's is now used only for levees and drawing-rooms. The Court of St James's is the usual designation of the British Court.

St James's Park lies southward from the palace, and extends over 87 acres. Within the last thirty years, it has been greatly improved, and is now richly emblished with avenues of trees, and a fine piece of water in the centre, which is stocked with waterfowl. On the east side is the Parade, where the body-guards on duty are mustered, and where the regimental bands perform in fine weather. On the whole, this park is one of the greatest ornaments of London. On the outskirts are situated the Buckingham and St James's Palaces, Stafford House, Marlborough House, &c.

JAMES'S POWDER is a patent medicine discovered by a Dr Robert James, who was admitted as a licentiate of the College of Physicians in 1765, and died in 1776, aged 73. The fame that he might otherwise have acquired—for he was a man of considerable reputation as a writer—was tarnished by his patenting his 'fever powders,' and still more by his falsifying the specification to such an extent as to render it impossible to prepare the medicine in any other form than his directions. Hence the Compound Powder of Antimony has been substituted for it in the British pharmacopoeia. From the analysis of the patent medicine, for which one or two London chemists assert that they have the true original prescription, it appears to consist of more than 50 per cent. of trinituric acid of lime, which must be altogether inert as an anti-febrile medicine; of from 33 to 45 per cent. of antimonious acid, and a little antimonite of lime and teroxide of antimony. The pharmaceutical preparation very closely resembles it. Both James's Powder (prescribed under the title of Paelia Jacobi verti) and antimonial powder are very uncertain in their operation, at one time possessing considerable activity, and at another being almost inert. Either may be prescribed in doses of about five grains, as a sudorific in fevers and rheumatic affections, and may be given alone, or in combination with a few grains of calomel.

JAMESON, Rev. John, D.D., a monitorious Scotch scholar, was born in Glasgow, March 11, 1759, studied for the ministry, and in 1781 was ordained pastor of a congregation at Forfar, in connection with the Original Secession body. In 1797, he was translated to Edinburgh, where he died July 12, 1838. J.'s reputation as a man of letters rests on his Etymological Dictionary of the Scottish Language (1808—1809), of which he published an abridgment in 1818, and to which he added a supplement in 1825. It is a work of great industry, and very considerable value as a collection of Scotch words, phrases, customs, &c.; but it possesses little critical merit, according to the present standard. Among J.'s other performances may be mentioned, An Historical Account of the Ancient Caledhas of Iona (1811); Hermes Hythicus, or the Radical Affinities of the Greek and Latin Languages to the Gothic (1814); An Historical Account of the Royal Palace of Edinburgh (1818); an edition of Burns's poetry (1820); and Biographical Sketches of Sir William Wallace. He also wrote several works of a professional nature, which do not call for special mention.

JAMESON, Robert, distinguished as a naturalist, was born at Bath, July 11, 1774, and died in Edinburgh, April 28, 1854. Although originally intended 679
JAMESON—JANIZARIES.

for the medical profession, J.'s strongly manifested love for the study of animals and plants early led him to devote himself to various branches of natural history. After having given evidence of considerable ability and indefatigable industry in various able memoirs, he went in 1800 to Freyberg, to be his pupil, and was elected in 1804 to the chair of Natural History in the university of Edinburgh; and during the term of his professorship, numbered among his students many of the best naturalists of the present day. In 1808, he founded the Scottish Society of Natural History; and in 1809, brought out his Elements of Geognosy, in which he gave a comprehensive exposition of the Neptunian theory as it had been modified by Werner. In 1812, he founded, in concert with Sir David Brewster, the Edinburgh Philosophical Journal, and in 1826 the Edinburgh New Philosophical Journal, of which he continued to be the editor till his death. His principal works, in addition to those we have already mentioned, are A System of Mineralogy (1804); A Mineralogical Description of the Country of Dumfartont (1805), which was intended to have been the first of a series of similar works on all the countries of Scotland, its Mineral and Mountainous Rocks, &c. (1821); and Elements of Mineralogy (1837). The Natural History Museum of the university of Edinburgh is largely indebted to the care and skill of J. for its present improved condition, for, besides having carefully arranged its collections, which had been almost created by his own and other liberal donations, he obtained, by his representations to government, an annual grant for its maintenance. He was a fellow of almost all the learned societies of Europe.

JAMESON, or JAMESON (George), an eminent Scotch portrait-painter, called by Walpole the Van Dyck of Scotland, was born at Aberdeen in 1856. Of his early history, nothing is known. He was at Antwerp in 1616, studying under Rubens, had Van Dyck as a fellow-pupil, and returned to Scotland in 1628. He was first patronised by Sir Colin Campbell of Glenorchy, for whom he painted many portraits of the kings and queens of Scotland; among others, 'Robert Bruce' and 'David Bruce.' His great talents being at an early age recognised, he was patronised by the nobility, and in 1633 Charles I. sat to him. He died at Edinburgh in 1644. Though the pupil of Rubens and associate of Van Dyck, his productions bear very little resemblance to those of either of these great masters; distinguished for their clearness of outline, delicacy and softness of shading, and beauty of colour, they have neither the richness of the former nor the vigour of the latter. Though celebrated only as a portrait-painter, he has left numerous historical, miniature, and landscape pieces. His productions are very numerous; the largest collection of them is in the possession of the Érâr of Breslauhne; and many others of the Scotch nobility possess paintings by him; there are also several in the halls of the university of Aberdeen.

JAMESON, Mrs Anna, an English authoress, born in Dublin, May 19, 1797. She was the daughter of Mr Murphy, a painter, and was married in 1827 to a Mr Jameson, a barrister, but soon after separated from her husband on account of her delicate constitution. She died 17th March 1860. Her principal works are — Diary of an Experience (1826); Loves of the Poets (1829); Characteristics of Shakespeare's Women (1832); Memoirs of the Early Italian Painters, &c. (1845); Short and Legendary Art (1848); Legends of the Monastic Orders (1850); Legends of the Madonna (1852); Common-place Book of Thoughts, Memories, Fancies (1854); and The Scriptural and Legendary History of our Lord, &c. as represented in Christian Art (1890).

In all her writings, Mrs J. evinces a fine fancy, a delicate, womanly perception of the beautiful, and a genuine poetic enthusiasm. She is regarded as one of the first art-critics in England, and has produced;

JAMROSADE. See Eggelia.

JAMU, a town and fort in the north of the Punjab, is in lat. 32° 44' N., and long. 74° 54' E. It stands, amid the more southerly mountains of the Himalayas, on both banks of an affluent of the Chenab, the town on the right side, and the fort on the left. It contains 8000 inhabitants.

JAMESVILLE, a city in Wisconsin, United States of America, on both sides of Rock River, 45 miles south-south-east of Madison. It is built partly on a plain by the river, and partly on a bluff 100 feet above it, where the public buildings are seen to great advantage. It is connected with Chicago, Milwaukee, and the towns on the Mississippi by intersecting railways. There is a large water-power for many mills and factories, and a state asylum for the blind. Founded in 1836, it had a population of 3000 in 1850.

JANIN, Jules Gabriel, a very clever French critic, was born at St Etienne, in the department of Loire, December 11, 1804, studied at the college Louis-le-Grand in Paris, and addicted himself to journalism at an early period. His wonderful piagnity of style, his airy grace of sentiment and wit, and his dashing paradoxes of criticism, have been greatly relished by his countrymen; so much so, indeed, that J., without fear of ridicule, has been able to dub himself le Prince de la Critique. For many years he made and destroyed literary reputations in the columns of the Journal des Débats. He has also written a good many novels, tales, narratives of tours, &c., among which may be mentioned L'As ne mort et la jeune Femme guillotinée, Contes fantastiques, Contes nouveaux, Voyage du Victor Olymp en Orient, Les Catacombes, La Normandie historique, pittoresque et monumentale, La Bretagne historique, &c., Voyage de Paris à la Mor., and Les Symphonies de l'Hiver.

JANINA, a city of Turkey, capital of the eyalet of Janina, or 'Plate of Greece,' is situated on the south-western bank of a lake of the same name, 40 miles inland from the shore opposite the island of Corfu. The lake of Janina, called by the ancients Pamvota, consists of two pear-shaped lakes, of which the larger is about 12 miles, its greatest breadth about 3 miles. At its southern end, stood the ancient city of Dodona. The city of J. stands in the midst of an extensive and fertile plain, which produces fruits and grain in abundance. Its chief buildings are 19 mosques, 6 Greek churches, a Greek college, and two synagogues. Gold brocade is here extensively manufactured by Greek workmen, as well as gold lace for the east, morocco leather, silk goods, and coloured linen. J. was long the head-quarters of the gifted but marauding Ali Pasha (q. v.). It is now in part deserted; its population, which was 40,000 under Ali Pasha, is now 25,000. Little is known of its early history.

JANIZARIES (Jeni-cheri, new soldiers), a Turco-Ottoman military force, recruited of the 추l< got a ucr o y< o (1850)
privileges soon induced many young Turks to seek admission into their body. There were two classes of J., one regularly organised, dwelling in barracks in Constantinople and a few other towns, and whose number at one time amounted to 29,000, but was afterwards reduced to 25,000; and the other composed of irregular troops, called Jamaks, scattered throughout all the towns of the empire, and whose number in 1600 was estimated at 150,000. At the head of the whole Janissary force was the Aga of the J., whose power was limited only by the danger of revolt, and extended to life and death. The J. were always ready to break out into diatribes of riots were their pay or perquisites were withheld. In times of peace, they acted as a police force. They served on foot; generally formed the reserve of the Turkish army, and were noted for the wild impetuosity of their attack. The sultan's body-guard was formed of them. The J., however, soon began to be very unruly; and their history abounds in conspiracies, assassinations of sultans, viziers, agas, &c., and atrocities of every kind; and that, by degrees, they became more dan-
groan to the sultan, and were defeated and their barracks burned, when 8000 of them perished in the flames. A proclamation of June 17, 1826, declared the Janissary force for ever dissolved. All opposition was defeated with bloodshed. Not forty of the worst were executed, and more than 20,000 were banished.

JAN MAYEN'S LAND, an island in the Arctic Ocean, named after a Dutch navigator by whom it was discovered in 1611. It lies between Iceland and Spitzbergen, and is the northernmost known volcanic land. Its highest point is the volcano of Beserberg, 1640 feet high, a cone covered with frozen mountain, from which flames and smoke have been seen to proceed, and the sides of which exhibit immense glaciers and frozen waterfalls. Another volcano, called Mosk, about 1500 feet high, was discovered by Scoresby in 1817. An interesting account of the island is to be found in Lord Dufferin's 'Letters from High Latitudes.'

JANSEN, CORNELIUS, a celebrated divine, born of humble parentage in 1585, at Akki, near Leerdam, in Holland, from whom the sect of Jansenists derives its name. He was nephew of the well-known biblical commentator, and Bishop of Ghent, of the same name. The studies of J. were divided between Utrecht, Louvain, and Paris. Having obtained a professorship at Bayonne, he devoted himself with all his energy to controversial and patristic studies, especially of the works of St Augustine. From Bayonne, he returned to Louvain, where, in 1617, he obtained the degree of Doctor, was appointed Lecturer in Hebrew, and occupied a prominent part in the affairs of the university, especially in a contest with the Jesuits, on occasion of which he was sent upon a mission to the court of Madrid. In 1630, he was appointed to the professorship of Scripture, and had distinguished himself by a pamphlet on the war with France, 'Mars Gallicus,' he was promoted, in 1636, to the see of Ypres. In this city he died of the plague, May 6, 1638, just as he had completed his great work, the 'Augustinus,' which proved the occasion of a theological controversy, the most important in its doctrinal, social, and even political results which has arisen since the Reformation. Its main object, in which it coincided with the scheme of doctrine already condemned in Ratisbon (q. v.), was to prove, by an elaborate analysis of St Augustine's works, that the teaching of this Father against the Pelagians and semi-Pelagians (q. v.), on Grace, Free-will, and Predestination, was (a) in direct (b) to the teaching of the modern, and especially of the Jesuit schools (see Molina), which latter teaching he held to be identical with that of the semi-
Pelagians. In the preface, he submitted the work to the judgment of the Holy See; but its publication, in 1640, being received with lord clamour, especially by the Jesuits, and at once referred to Rome for judgment, the Augustinus-together with the protagonist publications of the Jesuits-was prohibited by a decree of the inquisition in 1641; in the following year, it was condemned as heretical by Urban VIII, in the bull 'In Eminentiss. This bull encountered much opposition in Belgium; and in France, the Augustinus found many partisans, who were supported by a decided body of doctrinal preachers as an act of sympathy to the alleged laxity of moral teaching in the schools of the Jesuits, with whom the opposition to the Augustinus was identified. See also the eminent of the patrons of the Augustinus were the celebrated association of scholars and divines who formed the community of Port Royal (q. v.), Arnauld, Nicole, Pascal, &c. Nevertheless, the influence of the Augustinus was great and the Augustinus seven propositions (subsequently reduced to five) which were condemned as heretical by Innocent X. in 1653, hence arose the celebrated distinction of 'right' and of 'fact.' The friends of the Augustinus, with the Holy See; to judge of right the five propositions were justly condemned as heretical, yet denied that in point of fact these propositions were to be found in the Augustinus, at least in the sense imputed to them by the bull. A further condemnation was therefore issued by Alexander VII, in 1656, which was rigidly enforced in France, and generally accepted; and in 1668, peace was partially restored by Clement IX., at least all over the doctrine was repressed by the iron rule of Louis XIV. The more rigid Jansenists, however, and at their head Antoine Arnauld, emigrated from France, and formed a kind of community in the Low Countries. On the death of Arnauld in 1694, the controversy was revived for some years; but it was revived with new acrimony by the well-known dispute on the so-called 'case of conscience,' and still more angrily in the person of the celebrated Quenel (q. v.), whose 'Moral Reflections on the New Testament, although published with high ecclesiastical authority, at various intervals from 1671 till his death, 1710, was denounced to the pope, Clement XI., as a text-book of undisguised Jansenism. This polemical issued in 1713, in the controversy 'Unigenitus,' a condemnation in mass of 101 propositions extracted from the Moral Reflections, which, however, met with great resistance in France. The death of Louis XIV. caused a relaxation of the repressive measures, the regent, Duke of Orleans, was urged to refer the whole controversy to a national council, and the leaders of the Jansenist party appealed to a general council. The party thus formed, which numbered four bishops and many inferior ecclesiastics, was called, from this circumstance, the Appellants. The firmness of the pope, and a change in the policy of the regent, brought them into disfavour. An edict was published, June 4, 1720, receiving the bull; and even the parliament of Paris submitted to
JANSENS—JANUARIUS.

register it, although with a reservation in favour of the liberties of the Gallican Church. The Appellants for the most part submitted, the remainder being violently opposed: and on the accession of the new king, Louis XV., the unconditional acceptance of the bull was at length formally accomplished, the parliament being compelled to register it in a lit de justice. From this time forward, the Appellants were rigorously repressed, and a large number emigrated to the Netherlands, where they formed a community, with Utrecht as a centre. The party still remaining in France persisted in their invertebrate opposition to the bull, and many of them fell into great excesses of fanaticism. See CONVulsionARIES.

In one locality alone, Utrecht, and its dependent churches, can the sect be said to have had a regular and permanent organisation, which dates partly from the forced emigration of the French Jansenists under Louis XIV., partly from the controversy about Guise. The vicar-apostolic, Peter Codde, having been suspended by Clement XI. in 1702, the chapter of Utrecht refused to acknowledge the new vicar named in his place, and angrily joined themselves to the Appellant party in France, many of whom found a refuge in Utrecht. At length, in 1723, they elected an archbishop, Cornelius Janssen, whom the pope, in the form of episcopal consecration was obtained from the French bishop Vorlet (titular of Babylon), who had been suspended for Jansenist opinions. A later Jansenist Archbishop of Utrecht, Meinderts, established Haarlem and Deventer as his suffragan sees; and in 1763, a synod was held, which sent its acts to Rome, in recognition of the primacy of that see, which the church of Utrecht professes to acknowledge. Since that time, the formal succession has been maintained, each bishop, on his appointment, not having his election to the pope, and craving confirmation. The popes, however, have uniformly rejected all advances, except on the condition of the acceptance of the bull Unigenitus, and the recent act of the Holy See, in defining as heretical Catholic faith the dogma of the immaculate conception of the Blessed Virgin Mary, has been the occasion of a new protest. The Jansenists of the Utrecht Church still number about 5000 souls, and are divided over 25 parishes in the diocese of Utrecht and Haarlem. Their clergy are about 59 in number, with a seminary at Amersfoort.

So far as they can be said to possess a theological system, it may be described as a compound of Jansenist and ultra-Gallican principles.

JANSENS, ABRAHAM, a celebrated Dutch painter, is supposed to have been born in Amsterdam about 1569. Of a thoughtless and excitable disposition, he made himself completely miserable by his marriage with a girl of extravagant tastes, and spent his latest years in extreme want. The year of his death is unknown. Many churches in Flanders possess pictures executed by him; the most famous are the ‘Burying of Christ’ and a ‘Madonna and Child’, in the church of the Carmelites at Antwerp. There are also good specimens of his style in the galleries of Munich, Vienna, Dresden, and Berlin. J. displayed great vigour in drawing and designing; he was an admirable colourist, and he certainly ranks next, among the historical painters of the period—though at a considerable distance—to Holbein. CORNELIS J. probably born in Flanders, died in Amsterdam in 1663, acquired a reputation as a very fine painter of portraits and historical subjects.—Another eminent artist of this name was VICTOR HONSORS J. (born at Brussels 1644, died there 1739).

JANTHINA, a genus of gastropodous molluscs of the order Scutibranchiata, and of the same family (Haliotidae) with ear-shells. The shell is very similar in form to that of a common snail, but this Common Oceanic Shell (Jantitha frugilis).

Shell with the animal, the expanded a, head; b, mouth; c, tentacles; d, eye; e, border of the mantle at the entrance of the branchial cavity; f, foot, the posterior part, which is flail; g, lateral expansion of the mantle, provided for swimming; h, foot, anterior part forming a sort of pouch; i, bunch of adherent vessels, serving to suspend the animal in the surface of the water; j, m, eggs suspended under the vesicular bunch; n, shell.

and beautifully pellucid. These molluscs are remarkable as inhabitants of the open ocean, in which they swim at the surface of the water by means of a float formed of vesicles containing air, and secreted by the foot. To the under-surface of this float, the egg-capsules are attached. The vesicular float has no more anatomical connection with the animal than the shell has. The Janthines abound in the seas of warm climates; are plentiful in the Mediterranean, but rare on the British coasts.

JANUARIUS, St., a martyr of the Christian faith under Diocletian, was a native of Benevento, or at least became bishop of that see in the latter part of the 3rd century. According to the Neapolitan tradition, he was taken prisoner at Nola; and the place of his martyrdom, in 308, was Pozzuoli, where many Christians suffered the same fate. His body is preserved at Naples, in the crypt of the cathedral, and in a chapel of the same church are also preserved the head of the martyr, and two phials (ampullae) supposed to contain his blood. On three occasions in the last year of the church of St. Clare, where, after prayer of greater or less duration, the blood, on the phials being brought into contact with the head, is believed to liquefy, and in this condition is presented for the veneration of the people, or for the conviction of the doubter. It occasionally happens that a considerable time elapses before the liquefaction takes place, and sometimes it altogether fails. The latter is regarded as the sign of the worst import; and on those occasions when the miracle is delayed beyond the ordinary time, the alarm and excitement of the congregation rise to the highest pitch. Those who are curious as to the literature of the controversy respecting the abolished legend, or of finding authentic documents in the sixth volume of the Bollandist Acta Sanctorum for September.

JANUARIUS, St., ORDER OF, an order of knighthood, founded by King Charles of Sicily (afterwards Charles III. of Spain), on the 6th July 1738. It was abolished after the French invasion of 1806, and reintroduced in 1814. The badge is a gold octagonal white and red enamelled cross, with gold lilacs in the upper and side angles. The obverse represents St. Januarius in episcopal robe,
with an open book. The round middle of the reverse shows a golden open book, and two phials partly filled with blood. The knights are either Carelieri di Giustizia, who must count four noble generations, or Carelieri di Natale, for the Grazi of the month of November, although the Romans considered it as such far back as 251 B.C.

JANUS and JANA, two very old Latin divinities, male and female, whose names are merely different forms of Dionysus (probably the Sun) and Ianna (the Moon), are held sacred to Janus (q.v.), from whom it derived its name, and was added to the calendar along with February by Numa. It was not till the 18th c. that J. was universally adopted by Europeans as the first month of the year; although the Romans considered it as such far back as 251 B.C.

JANUARY—JAPAN.

January—Japan.

The great volcanic mountain Wusunchee on which they rest is still intensely affected by volcanic action. Earthquakes occur very frequently in J. although certain parts of the country are exempt. The Japanese reckon that, on an average, some one of their cities is destroyed every seven years by this agency. Japan has been called the land of mountains; but though these are very numerous, and many of them volcanic, they are of moderate elevation, and rarely attain the limits of perpetual snow. The climate generally is of a tropical description, with fertile valleys, picturesque landscapes, and a coast indented with magnificent harbours; the soil is productive, rich in mineral wealth, and teeming with a variety of agricultural produce. The great volcanic mountain Wusunchee, on a promontory of Kiwi, reaches to the line of perpetual snow, and is both feared and worshipped by the Japanese. The celebrated and sacred Fusi-yama ('Rich Scholar Peak'), the Parnassus of J., is an extinct volcano, the highest peak of which reaches to the height of 14,177 feet. Springs, lakes, and rivers are numerous; but the last, being sand-choked and very impetuous, are valuable chiefly for the purposes of irrigation.

Our knowledge of the climate of J. is yearly increasing. June, July, and August are the months of rain, which sometimes descends in unceasing torrents. The months of October and November are the pleasantest and most genial, and, from being then, when fine weather is enjoyed without the scorching heat of summer. The summers are very hot, and the winters in the northern parts almost Siberian; the thermometer rising to 96° in the shade in the former, and sinking to 18° below zero in the latter season. Aloveck says: 'The thermometer in the shade (during the summer) ranges from 70° to 85°, and averages 80 between the morning and the evening, while it is sometimes below 70° at night.' Hurricanes and waterspouts are frequent; dense fogs hide the sun, sometimes for four or five days together; and about the change of the monsoons, typhoons and equinoctial gales frequently sweep the Japanese sea.

Vegetable Productions.—In Hodgson's Japan will be found a systematic catalogue of Japanese flora by Sir William Hooker. We can only mention a few of the most noteworthy trees and plants. Chesnut, oak, ash, alder, and deciduous, are the chief. Beech, elm, cherry, dwarf-oak, elder, sycamore, maple, cypress, and many other trees of familiar name abound. The evergreen oak and maple are the finest of all Japanese trees. The greatest forest of pine, and oaks of preglious size, grow in Yesso; but the Rhus vernicifera or lacquer-tree, the Laurus camphora or camphor-tree, the Broussonetia papyrifera or paper-mulberry, the Rhus succedanea or vegetable wax-tree of J., are among the remarkable and characteristic trees of the country. Bamboo, palms, including sago-palms, and 150 species of evergreen trees, likewise flourish. Thus, the vegetation of the tropics is strangely intermingled with that of the temperate or frigid zones; the tree-fern, bamboo, bamboo, and palm grow side by side with the pine, the oak, and the beech, and confere in great variety. Nymphaeas and arumias fill the lakes and morasses. The tobacco-plant, the tea-plant, the tea, and the rice, are cultivated in the temperate zone, and maize and all are cultivated. The flora of J. bears a remarkable resemblance to that of the North American continent.

Agriculture is the chief occupation of the Japanese. They are very careful farmers, and their farms are models of order and neatness. They bestow great care upon manures, and thoroughly understand cropping and the rotation of crops. The cultivated land is chiefly a light friable loam of

Paper Features.—The islands of J. appear to be of volcanic origin, and that part of the Pacific
JAPAN.

great fertility. It grows cotton, rice, wheat, maize, buckwheat, millet, potatoes, and turnips. The rice harvest commences in October. Wheat is sown in drill from November and December, and reaped in May and June. Flails and winnowing-machines, similar to those used in England, are common.

Animals.—Wild animals scarcely exist in J., in consequence of the universal cultivation of the soil. A few wolves, foxes, and wild bears still roam in the north of Nipon. Wild deer are protected by law. The principal domesticated animals are horses, of which there is an indigenous race; oxen and cows, used only as beasts of burden; and dogs, held in superstition as a votive offering by the people. Birds are very numerous, and include two kinds of pheasants, wild-fowl, herons, cranes, and many species common both to Europe and Asia. There are few reptiles; and of insects, white suits, winged grasshoppers, and several beautiful varieties of moth, are conspicuous.

Mineralogy.—J. is very rich in minerals. The gold mines of Matsumai and the north-east part of Nambu have long been celebrated; but the north of Nipon is, according to the Japanese, one continuous bed of gold, silver, and copper. Silver also comes from the islands to the west of Matsumai, from the province of Shanday, and from the islands in the vicinity of Neagata. The iron mines of Yesso are said to supply European wants. Both lead and copper mines are worked within a few miles of Hakodadi. The sulphur of Yesso and the adjacent isles is almost inexhaustible, and of wonderful purity. In its abundant supply of coal, J. resembles Great Britain. The coal extends from Nagaasaki and Fuzo to Yesso and Saghalien. Basalt, felspar, green-stones, granites red and gray, rock crystal, agate, carnelian, amber, scorias and pumice-stone, talc, alum, and other minerals are found in greater or less quantities.

Inhabitants.—Ethnologists have referred the Japanese to different types of mankind; Latham classifies them as Turanian—a tribe of the Asiatic peninsular stock; Pickering, as Malaya; Prichard, as belonging to the same type as the Chinese; and in the Narrative of the United States' Expedition, they are ranked as a branch of the Tartar family. Physically, the Japanese is distinguished by a broad head and face, round frontal bones and a high forehead, slightly oblique eyes—the irises of a brown-black colour, the eyebrows heavy and arched. The complexion varies from a deep copper colour to the fairness of western nations, but is more characterised by a light olive tint. The expression of the face is mild and animated. The mental and moral characteristics of the Japanese are a proud, sensitive, and somewhat vindictive disposition, punctilious notions of honour, together with pride of birth; and they are generally described as a friendly race, good-humoured, contented, industrious, intelligent, brave, frank, manly, energetic, and polite, with the exception, however, of the military, feudal, and official caste. The town costume of the Japanese gentleman consists of a loose silk robe extending from the neck to the ankles, but gathered in at the waist, round which is fastened a girdle of broadened silk. Over this is worn a loose, wide-sleeved jacket; and over both, a spencer, decorated with the wearer's armorial device. A cylindrical cap made of bamboo and silk, white stockings, and neat straw sandals, complete the attire. Trouser is only worn by official persons on occasion of special ceremony. A head entirely shaven is the distinctive mark of priests and the higher class of medical practitioners; in others, the hair is shaved off about three inches in front, combed up from the back and sides, and placed into a tuft at the top of the head, where it is confined by pins of gold or tortoise-shell. The

hair of the women is more abundant, but otherwise their dress very much resembles that of the men.

In the country, a short cotton gown is often the

only clothing, and the lower classes go almost in a state of nudity. The men are generally elaborately tattooed over the greater part of the body with figures of men and women, bright-blue dragons, lions, tigers, &c. The women have a mania for painting and powdering their skin.

Manners and Customs.—The most remarkable custom of the Japanese is that of Harari-kari or Hara-so (Kiri, or Hara so Kiru, i.e., 'belly-cut'), a legalised mode of suicide, by making two cross-cuts on the abdomen with a sharp-pointed knife. This custom, according to some recent accounts, is now less frequent, and the ceremonies with which it was once performed have become obsolete. There are still, however, professors of the art in most large cities. The curious custom of may-bow or naibow consists in ostentatious secrecy as regards events, or in cognito in reference to persons.' Well-known events are totally ignored, and individuality is unremarked upon. The Japanese gentleman dressed in light blue or white.

The social position of women is, in some respects, more favourable than in most pagan countries. The ladies of Japan, however, live in strict seclusion, and little is known about them. Female education is not neglected. Polygamy is not allowed, but the power of divorce is permitted to the husband by law. The laws against adultery on the part of the wife are severe, and death is the penalty, which may be inflicted by the husband. He, on the contrary, may take as many concubines as he pleases or can afford. The marriage ceremony is an important part of social etiquette; the families of both bride and bridegroom meet and celebrate the event. Saki bowls abundantly, and great festivity and hilarity prevail. When a maiden marries, her teeth are blackened, her eyebrows plucked out, and artificial ugliness is henceforth cultivated to the greatest possible extent. The Chinese custom of affixing children is followed by the upper classes, and aristocratic usage interdicts a personal interview to the bride and bridegroom previous to marriage, but this rule is now much relaxed. Prostitution is a legalised custom; and a father may sell his daughter, for this purpose, for a term of years;
JAPAN.

whilst the Japanese gentleman, notwithstanding his high notions of honour, often chooses his wife from among the inmates of those houses of ill fame, which are at once supported and controlled by government. The bath is a great institution in Japan, and forms a kind of people's parliament. It is the general custom throughout the country for men and women to bathe together, with a total absence of decorum, but without sense of immodesty. In J., the social position of women is also low, both by birth, and the line that separates class from class is not only clearly defined, but impassable. Daimios and samiuos, priests and soldiers, are considered to belong to the higher classes; and in the others are included medical men, merchants, retail dealers, and labourers. There are eight classes of society, half of which belong to the upper, and the other half to the lower ranks of society. Men of rank only can enter a city on horseback. The government of J., is in J. in a description of palanquin: the common sort, made of bamboo, is called a congo; the better kind, made of lacquered wood, a norimono. The Japanese manifest great regard for the dead. The ancestral tablet (teki) is placed in the family shrine with the household gods. In a Japanese cemetery, the solid and elaborately carved granite monuments are beautiful specimens of architectural taste. Each body is buried in a sitting posture, with the hands folded on the breast. The coffins are all circular. The Japanese observe many holidays, and celebrate the opening of the year in the Chinese fashion. There are, too, many holidays of a religious character, but the national festivals are five in number. The Japanese are a theatre-loving people, and inve- terate gamblers. They delight in wrestling—their national sport—perform wonderful feats in spinning tops, are very expert jugglers; and their game of archery is imitated in the Chinese model, and is called the 'game of the army' or Tycoon (Chinese, T'ai Koon, i. e., 'Great Lord'), as he is called in recent treaties, the secular emperor; but the Japanese, from the highest to the lowest, recognise one sovereign only, viz., the Mikado, who dwells at the sacred capital, Mikado, and is the only emperor de jure—the descendant of a long line of kings. The Tycoon is the head of the executive, solely as the lieutenant or generalissimo of the Mikado, from whom he receives his investiture; but he is virtually emperor, and holds his court at Yeddo. The one reigns, but does not govern; the other governs, but does not reign. This kind of double sovereignty arose, it would appear, as follows: J. was consolidated into one empire 400 B. C., and the most powerful of the native chieftains became the imperial ruler. During subsequent civil wars, the administration of military affairs was vested in an hereditary 'generalissimo,' commonly called the chief of the army or the Tycoon. This high officer, in the person of Yoritomo, obtained the greater share of sovereign authority in 1143, under the title of Sioqoon; and in 1585, Taiko-Sama, at that time Sioqoon, deprived the reigning Mikado of what yet remained to him of executive power. The consent of the Mikado is still required—nominally, at least—to give validity to the acts of the Tycoon, which are professedly done in the name of the de jure emperor.

It appears, however, that the Tycoon himself has been shorn of much of his power by the two councils, composed of the daimios or territorial lords and princes; and these perform the imperial cabinet at Yeddo, and the real executive government at the present time. The higher council of five is called Go to new; 'Imperial Old Men' or 'Imperial Senators.' The lower council, of seven members, is termed Waka tsuji, or Young Old Men, or 'Imperial Senators.' The office of Sioqoon is hereditary in the line of male descent; but if this should fail, a member of one of those families originally allied by relationship to the Sioqoon, is chosen by the great daimios of the empire, and the councilors at spiritual emperor necessary to render the election valid. 'As a general summary,' says the Bishop of Victoria in his able and philosophical treatise on J., from which, and Sir H. Alcock's able work, this account of the government of the country has been principally derived, 'it will be apparent that while in China the theory of government is a bureaucracy—a form of administration carried on under an autocratic emperor, served by an aristocracy of literati—J. is an oligarchy, with the democracy by literary trial and competitive examination, conducted without preference of birth, and in total absence of hereditary caste—Japan, on the contrary, is ruled by an aristocracy of 264 hereditary daimios, or territorial lords of the soil, with a sole oligarchy of inferior councillors, who, at their head, controlling the secular emperor, having their title to power grounded on the privilege of hereditary descent and caste, with all the wealth and prestige of an empire concentrated upon the capital, as the metropolis and seat of power. A middle class is unrecognisable in such a system of government.'

The laws of J. are severe and sanguinary in principle, but the death-penalty does not always occur. That the death-penalty is, however, modified in practice, and the tribunals of justice are seldom corrupt. There is no written code of laws,* and they consist of imperial edicts and immemorial usages. Every new edict is read by the magistrates to the people, and affixed to all public buildings. The people have a share in promoting civil and criminal administration. A street is formed into corporations of five families, and all are mutually responsible for the conduct of each member. In each corporation there is an electoral official called Ottona or Headborough, who registers births, marriages, and deaths; and his appointment must be confirmed by the council of state.

Two remarkable and leading features in the political system of J. are feuflid and spionage. The imperial demesne consists of several provinces and towns, but the empire is divided, for the most part, into principalities, which are ruled by the daimios or territorial princes directly from the crown. The feudalism of J, bears some resemblance to that which prevailed in England under the Plantagenets—we go back to the Europe of the 12th century. The duties of the office are military service and payment of a stipulated rent. The army of the Tycoon is said to amount to 100,000 men, and joined to those of the princes of the empire, it is estimated at 401,000 men; but in discipline and knowledge of the art of war, it is very deficienit; the dress is a borrowed one, the armament is matchlocks, and even bows and arrows. The navy consists of war-junks built upon the old Dutch model. A jealous surveillance or spy system is

* The ministers told Alcock, however, that a written code exists, and that subsequently obtained a copy of printed laws and edicts; but 'whether only a local portion, or the whole, yet remains to be ascertained.' (Vol. I. p. 410.)
JAPAN.

established, and runs through every grade of society.
The Tycoon, no less than the humblest private
citizen, is subject to this espousage; nor can the
Japanese believe any country to exist without it.
Mr Oliphant, speaking of an interview between
Lord Elgin and the officials of J., says: 'So when
everybody was watching everybody else, it was
only natural that the Japanese should wonder
who was watching us. They solved this difficulty
in an amusing way. Finding that there was only
one, Elgin, in their midst, they order or bade
also that his letter had been signed Elgin and Kin-
cardine, they gave us to understand, in the least
offensive way possible, that Kincardine, who was
nowhere visible, they supposed to be engaged in
keeping his eye on Elgin.'

In addition to the crown lands, the revenues
of government are raised by taxes upon houses and
land within the precincts of the towns; and there
is an export or import duty on all articles of
commerce. Forced loans are also, at certain times,
exacted from the public. A modified system of
slavery exists; it is a contract by which an indi-
vidual sells his services for a stated period, at the
end of which time he is again free.
The daimios, or territorial princes of Japan, play
no unimportant part in the history of the country, and rule large
provinces with despotic authority and
almost independently of the central
government. There are
now 264 vassal chieftains of
the first class. These are the daimios
proper, with revenues varying from
10,000 koku upwards. In addition, there is
some 1,000,000 koku at.
The policy of the Tycoon is to divide
the territories of these princes,
and so, by weakening their power,
to bring them more under his
authority. The greater part
of the land is divided amongst these
grandees, who receive seven-tenths
of the produce of rice, whilst the
remainder is reserved to the
cultivators. The great feudal
barons must spend every alternate six months in
Yedo, and their wives and families are always
detained there as hostages.

Religious of Japan.—The two principal
and national religions of J. are Shintoism or Sun-ryusmus,
(from sin, the gods, and ryu, faith), the ancient
creed of the country, and Buddhism, which is exotic
and comparatively modern. The doctrine of
Confucius, as held by the literati of China, has also
considerable influence under the name of Sooto,
or 'the way or method of philosophers;' but it is
less a religion than a system of morals and phil-
omeph. 1. Shintoism. The hierarchy of Sun-ryu is
composed of the Mikado, two ecclesiastical judges,
together with the monks and priests. The chief
object of Sintu worship and belief is Ten-cho dai-sin,
the Great Sun-goddess. The spiritual emperor,
Mikado, is held to be the direct descendant of the
sun-goddess, and, as such, unites in his person
all the attributes of the deity. The minor deities
of Sintuism are very numerous, for every hero,
warrior, patriot, or public benefactor receives a
regular apotheosis and canonisation after his
death, and is henceforth reckoned among the kami
or demi-gods. Every district has its patron saint or
kami; and the shrines erected to the popular
divinities are innumerable. Sintu temples are
usually built on elevated ground, and surrounded
by groves; no idols are visible in them; but above
and around, written sentences are inscribed. A
mirror, as an emblem of the purity required in the
worshippers, is placed on the altar. The chief
doctrines of this indigenous religion of J. are—

1. Inward purity of heart; 2. A religious abstinance
from whatever makes a man impure; 3. A diligent
observance of the solemn festival and holy days;

4. Pilgrimages to holy places; and 5. A habit of
some, chastising and mortifying the body. The
form of worship is simple: the worshippers first
wash themselves in the font, pray opposite the
mirror, throw a few cash into the money-box, and
finish by striking a bell, to intuate that their
religious duties are over.

2. In J., Buddhism, which was introduced
552 a. d., has been modified by its contact with
Shintoism, with which it has to a certain extent
amalgamated. No less than eight Buddhist sects
exist in Japan. Buddhism has properly no priests,
but here the monks appear to have assumed the
functions of that order. Dr Smith has given an
interesting description of a Buddhist service as
he saw at one of the temples in that country (see
his Ten Weeks in Japan, p. 34). 'Amongst the
services which I ever witnessed,' he says, 'I seldom
beheld in a pagan country an assemblage of native
worshippers so nearly approaching the appearance
of a Christian assembly, and the details of an
ordinary Christian service.' Amongst the more
educated classes, the same sceptical indifference to
the religious observances of the multitude that
prevails in China is observable. The religious duties
of the Japanese consist chiefly in worship at the
temples, and the observance of festivals, pilgrimages,
periodical worship of tutelary divinities, reverence
to parents, obedience to magistrates, and more than
all, the customary offerings at ancestral tombs.
The Japanese Written Language.—The principles of
duality, which pervades the life of the Japanese,
extends to their mode of writing, for two distinct
alphabets and kinds of writing are in use. There
is, 1st, the ideographic system of Chinese hier-
glyphic symbols, which dates from the 3d c. A. D.;
and 2ndly, the phonetic syllabarium, of more recent
invention, consisting of an alphabet of 47 characters,
and a few supplementary monosyllabic sounds.
Prior to either of these, some antique form of
writing, now consigned to oblivion, is supposed to
have existed.
The phonetic alphabet, invented about the year 810 A.D., is known as the Hiragana form of character. In process of time, this system was rendered more complex by the addition of variations, and this led, apparently, to the introduction of another and simpler alphabet, entirely without variants, and known as the Katakana character. Both these phonetic systems are written in perpendicular columns. It is not a little remarkable that the Chinese ideographic symbols retain their ascendancy over the indigenous alphabets, and are adopted almost exclusively for diplomatic documents and the higher class of books. In common life, the Chinese written language is familiar and constant use.

There is no similarity whatever between the spoken languages of China and J.; the latter—one of the softest tongues out of Italy—is not very difficult of acquisition, and is without the Chinese system of intonations; it is not monosyllabic, but what Dr Latham calls agglutinate.

The literature of J. is abundant and various, and includes works on history and science, encyclopedias, poetry, prose fiction, and translations of European works. Besides original writings, the Japanese have adopted the whole circle of Chinese Confucian literature; the Chinese classics indeed form the basis of their literature, system of ethics, and type of thought.

In the mechanical arts, the Japanese have attained to great excellence; especially in metallurgy, and in the manufacture of porcelain, lacquer ware, and silk fabrics; indeed, in some of these departments works of art are produced, so exquisite in design and execution, as to more than rival the best products of Europe. The Japanese have long understood lithochrome-printing. Their drawings of animals and figures generally are wonderfully graphic, free, and true to nature; but in landscapes they fail, from erroneous perspective; and of the art of painting in oils, they are entirely ignorant.

New Silver Itabone (three to a dollar in 1859; in 1860, two only were sometimes offered.)—Hodgson’s Japan.

A Junk in the Bay of Yeddo, from a native drawing—Oliphan’s Japan.

A commercial intercourse with J. has sprung up since the opening of certain Japanese ports to European merchants, and foreign settlements have been formed. Tea and silk are the staple exports. Printed cottons, camlets, shirtings, gingham, flannels, canvas, and window-glass are amongst the imports from Europe chiefly in demand. The whole trade of J. with foreign countries, in the year 1861, amounted to rather more than twelve hundred thousand pounds; the total imports being £418,000, and exports £862,000.

The yzec, or iron cash (the 5320th part of a dollar), is the base of the Japanese currency, and is their only real circulating medium—the people exchange at the rate of two or three to a dollar. The following illustration represents a copper coin.

Japanese Copper Coin.—Hodgson’s Japan.

The late treaties failed to establish a fixed standard of exchange; and when the trade was first opened to Europeans, the coins were bought at one-third their real value; but the Japanese discovered their error, and stopped the export of gold money. The following are the most important stipulations of the Treaty of Commerce between Her Britannic Majesty and the Tycoon of J., signed at Yeddo, August 26, 1858, and ratified at Yeddo, July 11, 1859.

Article 2. Her Majesty may appoint a diplomatic agent to reside at Yeddo, and consuls at all or any of the open ports.

Article 3. The ports of Hakodate, Kanagawa, and Nagasaki shall be opened to British subjects on the 1st July 1859; Nagata, or another convenient port on the west coast of Japan, on the 1st January 1860; Higo, on the 1st of January 1861, and in all these ports and towns, British subjects may permanently reside, the general boundary of their liberty being ten ri in any direction; and the 13 is equal to 4276 yards English measure. From the 1st January 1862, British subjects shall be allowed to reside in the city of Yeddo, and from the 1st January 1863, in the city of Osaka, for the purposes of trade only.

Article 9. British subjects in J. to be allowed the free exercise of their religion.

Article 10. All foreign coin shall be current in Japan. Coins of all descriptions (with the exception of Japanese copper coin) may be exported from Japam.

By article 22, it is agreed that either of the high contracting parties, on giving one year’s previous notice to the other, may demand a revision of the treaty on or after the 1st July 1872, with a view to the insertion of such amendments as experience shall prove desirable.

Article 23 stipulates that the British government and its subjects shall be allowed free and equal participation in all privileges that may have been, or may be hereafter granted by the Tycoon of J. to any other nation.

The 24 articles of the treaty are followed by certain trade regulations. It must here be noted that our treaty relations...
with J. rest upon a very sandy foundation. They were made with the Tycoon who governs only in the five imperial ports and their adjacent districts, and it is more than doubtful whether they have ever been ratified by the Mikado, the only recognised sovereign of the empire. The treaties were yielded through fear, and are systematically and persistently rendered inoperative. The Tycoon's government has been denominated from the various articles which are stipulated for the opening of Yedo, January 1862, as well as the ports of Nagata, Hoiso, and Osaka. And a delay of five years has been granted; but made conditional on greater facilities for commerce being afforded, by the Japanese government, at the ports already open, the removal of certain grievances, and the giving of better guarantees for the security of the lives of foreigners. But recent accounts—the latest of which (April, 1863) reports the burning of the British Legation—immissitably demonstrate the hostility of the influential classes in J., and of the Mikado, to intercourse with foreigners.

Hasten—The empire of J. dates from the 7th c. a. c., and one emperor ruled the country till 1143, when Yoritomo possessed himself of the greater share of sovereign power, under the title of Seso, and towards the close of the 16th c., the Saviour of Japan, the Mikado, became the controller of all executive authority, and became the de facto sovereign of Japan. The Portuguese commenced trading with the country in 1540; the mission of Francis Xavier for the first time in 1549, and at one time it seemed probable that J., as a nation, would embrace the Roman Catholic faith. The intrigues of the missionaries at last excited the alarm of the government, which, urged on by the jealous machinations of the Dutch, who had appeared on the scene in the year 1600, decreed the expulsion of the Portuguese and the extermination of the Christian religion. The Dutch now monopolised the trade, and submitted to the grossest indignities. The policy of exclusion and repression of Christianity was fully carried out by the celebrated Taku-Sama, his successor Eyay-yes, and the imperial edict of 1638 a. p. Notwithstanding several attempts on the part of European nations to open intercourse with J., the government maintained its isolation until the country was opened to the five great western powers by the American treaty of March 31, 1854, the result of the United States' Expedition under Commodore Perry. The Dutch now got hold of their most galling complaint. The Russian admiral negotiated a treaty, October 1857. The Dutch secured further privileges; and in 1858 followed the American, English, and French treaties. Thus J. once more took its place amongst the family of nations.—See The Capital of the Tycoon, by Sir Rutherford Alcock, K.C.B., &c. (Lond. 1863); Ten Weeks in Japan, by George Smith, D.D., Bishop of Victoria (Lond. 1861); A Residence at Nagasaki and Hokkaido in 1859—1860, by G. P. Holmes (Lond. 1861); Japan, &c., by H. A. JAPANNING—JARGONISING.

JAPANNING is the art of giving a coating of varnish and other materials to certain manufactur-
JARNAC—JASMINE.

is in the same relation to the excitement and violence, as the rapid motion, the furious gesticulation, and the tendency to injure and destroy everything that is seemly and harmonious. The tone in which they are uttered is generally harsh and distasteful; and the intense passion thrills through every muscle, through those of the vocal apparatus as well as of the arm raised to strike. Jargoning is, in all probability, involuntary. It occurs at the onset, and, other

The Huguenots, Duke of Chartres the, in 1620, and the

and those of drums, of the 26,000 and 40,000, which are not only, but are said to have been found in the ancient Hebrews, which is quoted twice (Joshua x. 13; 2 Samuel i. 18). Regarding its character and contents, there has been much speculation. Talmudic and later Jewish authorities identified it variously with Genesis (sometimes called 'the Book of the Upright'), Deuteronomy, Judges, &c., to all which notions there is the obvious and fatal objection, that the two quotations from it which survive are not to be found in any of these books, and could not possibly be found in the first two, as they refer to incidents which occurred at a subsequent period in the national history. The conjecture of the Syriac and Arabic translators has been adopted by Dr. Lowth, Hecker, and other scholars, viz., that the Book of J. was a collection of national ballads—a Hebrew minstrelsy, in short—recording the warlike deeds of the national heroes, or singing the praises of otherwise celebrated men. Gesenius is inclined to adopt the same view, and suggests that it may have acquired its name, 'the Book of the Upright,' from having been written chiefly in praise of upright men. Donaldson, in his recent work, Jashar, or Fragmenta Archetypi, Carnissmum Hebraicum in Manuscriptis Hierosolimitanis Testamenti pessimi tessellata, contends for its being a composition of the age of Solomon, and a work of Nathan and Gad. He conceives that it originated in the desire of the more religious of the community to possess a record of the national history which should chiefly set forth the righteousness of the true Hebrews, and he attempts to extract from the so-called canonical books of the Old Testament such passages as he believed to have originally formed part of it. It must be added, however, that Dr. Donaldson's theory has met with little favour either from the mass of German scholars or from the few in England who are competent to consider the question.

JASMINE, the most eminent modern patois poet of France, and, in the words of his ardent admirers, 'the last of the troubadours,' was born at Agen in 1798. He has given in his Souvenirs a humorous account of his early life. According to it, he was of very bumptious birth, and was set to learn the trade of a hair-dresser, which he agreed well with that of poet, as he himself says, because both are a kind of head-work. His poetry is full of beauty and power; the pathos of his serious pieces, and the wit and poignancy of his comic productions, are unequalled, and both have been received with great enthusiasm in France, and even in other parts of Europe. He was made a Chevalier of the Legion of Honour by Dr. Lowth, Herder, and others. His works are De col Mori (1825); Los Chilhiri (Chirivari, 1825), a comic poem; L'Abajo de Castel-Cuile (The Blind Youth of Castell-Cuile, 1836), translated by Longfellow; and Las Papilotas de Jasmin (The Curls of Jasmin), of which the first part appeared in 1833, and the second in 1843.

JASMINE, or JESSAMINE (Jasminum), a genus of plants of the natural order Jasminaceae. This order is allied to Oleaceae, and contains about 100 species of shrubs, some of them climbing, and many of them having exquisitely fragrant flowers. It
JASON JAUNDICE.

As chiefly natives of the warm parts of Asia. Many belong to the genus J., which has its calyx and corolla each 5 or 8-leaf, two lamons attached to and included within the tube of the corolla, and a two-lobed berry, one of the lobes generally abortive. The name J. is from the Arabic Jasmeen. The Common J. (J. officinale) is a native of the south of Asia, but is cultivated in the southern parts of Europe, and as far north as the Tyrol and Switzerland. In more northern regions, it is much cultivated in gardens, but does not easily endure very severe winters. It is a shrub from six to ten feet high, with evergreen pinnate leaves, the terminal leaflet the largest, and very fragrant white flowers. The flowers were formerly employed in medicine, for strengthening the nervous system, but are now only used for preparing Oil of Jasmine, a delicious perfume. The commercial oil of jasmine, however, is not the pure essential oil, but merely oil of benz flavoured with it, and is prepared by placing layers of the flowers alternately with layers of cotton soaked in oil of benz. —J. grandiflorum, a native of the East Indies, has flowers still more fragrant than those of J. and from those of J. Sambac, oil of jasmine is also made. The flowers of J. Sambac are often scattered about in houses and temples in the East Indies, to diffuse their fragrance. —Several other species, some with erect, and some with drooping stems, are not uncommon in gardens and green-houses. Some have white, and some have yellow flowers. Oil of jasmine cannot be obtained from J. flowers by distillation.

JA'SON. See ARGONAUTS.

JASPER (Gr. loftie), a mineral generally regarded as one of the varieties of Quartz (q. v.), and distinguished by its opacity, owing to a mixture of clay or other substances with the silica of which it is chiefly composed. There are many kinds of J., some of them of one colour, as brown, red, yellow, green, white, blue, or black, and some variously striped, spotted, or clouded with different colours. J. is a very abundant mineral; it is found in veins and embedded masses in many rocks, sometimes appearing as a rock of which whole hills are formed, and is very common in the shape of pebbles. It has been prized from the most ancient times for ornamental purposes, as it takes a high polish. Many kinds of it are very beautiful; and it can often be obtained in pieces of large size, so that it has been made into rings, seals, and other small articles, but for the decoration of palaces. One of the best known kinds of J. is found in Egypt, and is therefore called Egyptian Jasper. It is generally yellow, prettily mixed with brown. —J. with very distinct stripes is called Ribbon Jasper. —The kind called Porcelain Jasper is rather rare. It is often full of minute holes, or is cracked in all directions. It is regarded as a kind of natural porcelain, formed by the action of fire.

J'A'SSY, the capital of Moldavia, one of the Danubian principalities, is picturesquely situated on the banks of the Abouta, near the borders of Bessarabia, and about ten miles west of the Pruth. It is irregularly built and dirty, and in its crooked streets the palatial mansion of the Moldavian nobles alternates with huts of the most inferior description. It contains about 90 ecclesiastical edifices, one of which dates from the 14th century. On a height is the Prince's Court, formerly the residence of the governor of Moldavia. The streets are covered with dust in summer and with mud in winter, on which account, conveyances are here in great requisition, and every one except the Jew and the mendicant employs a drosky. In J., there are 1390 private carriages, 8000 droskies, and 12,000 horses. The manufactures of the town are few; there is, however, considerable trade in agricultural produce. Pop. 70,000, of whom about 30,000 are Jews.

JASZBERENY, a considerable town of Hungary, in the county of Jaszy and Rumania, is situated on both banks of the Zagyva, 42 miles east of Budapest. Pop. 18,000, who are employed in agriculture and in the trade in corn, cattle, and horses.

JATAKA (literally, relating to birth) is a collection of books containing an account of 550 previous births of Skyn Muni, or the Buddha. Several tales that pass under the name of Josp's fables are to be found in this collection of legends.

JATIVA, or XATIVA, SAN FELIPE de, a town of Spain, in the province of Valencia, 22 miles south of the city of that name. Its climate is delicious, and the well-watered plain on which it stands is luxuriant in fruits and flowers. Its trade and manufactures are unimportant. Pop. 13,200.

JA'UER, an interesting old town in Silesia, Prussia, situated on the Neisse, 10 miles south-east of Liegnitz. The town is famous for its sausages; and there is a weekly corn-market, which is regularly held on the 1st of every month, and is the most important in Silesia. The town was for many years a very prosperous town, being the only market for the linen-trade of Silesia; but the Thirty Years' War del pared to reduce its extent and prosperity. Pop. 7690.

JA'UNDICE, a yellow colour of the skin and conjunctiva of the eye, arising from the presence of the colouring matter of the bile in the blood and tissues, is a symptom of various disordered conditions of the system, rather than a special disease. With this colouring of the skin and eyes the following symptoms are associated: the faces are of a grayish or dirty-white tint, in consequence of the absence of bile, and the urine is of the colour of saffron, or is even as dark as porter, in consequence of the presence of the colouring matter of the bile. There is sometimes, but not in the majority of cases, an extreme itching of the skin. It is a peculiar belief, as old as the time of Lucretius—

Lurida prateria fiant quaecumque tuerit argasti—
that to a jaundiced eye everything appears yellow. This, however, like the preceding, is only an occasional symptom. The most obvious cause of jaundice is some obstruction of the gall-ducts, preventing the normal flow of bile into the intestine. This obstruction may arise in any of the following ways: 1. It may be caused by the impaction of a gall-stone in the common hepatic duct. See LIVER. In this case, the jaundice is usually of short duration, and disappears soon after the gall-stone has passed into the intestine. 2. Another cause of jaundice is the obstruction of the gall-ducts by cancerous disease of the pancreas, by tumours in the liver, or by a diseased condition of the duodenum, the portion of small intestine into which the common hepatic duct opens. In these cases, the obstruction is usually permanent, and causes a persistence of the jaundice. 3. Obstruction or closure of the gallducts sometimes occurs in the inflammation of the liver that is brought on by spirit-drinking, and sometimes may be caused by inflammation originating in the ducts themselves, which, from their small size, may be readily caused by inflammatory swelling of their mucous membrane. 4. The jaundice that occasionally arises from constipation, or that occurs during the advanced stage of pregnancy, is probably caused by pressure upon the common hepatic duct.
But although jaundice is frequently caused by some of these mechanical impediments to the flow of bile into the intestine, it results primarily and solely in a great number of cases from the secretion of bile being suppressed or deficient. The jaundice may be suppressed so as to cause jaundice by a sudden mental shock or by continued anxiety. Various poisons in the blood may also suspend the secretion of bile to such an extent as to cause jaundice. It may be induced in this way by the salts of copper and of mercury, by opium, and by the poison of serpents; and it often occurs, from the poisoned state of the blood, in the course of fevers, especially the virulent fevers of tropical climates.

The treatment must be chiefly guided by reference to the conditions which give rise to it in any particular case, and should never be attempted without professional advice.

JAVA—The Queen of the Eastern Archipelago, a most valuable colonial possession of the Netherlands, is situated in lat. 5° 32'—8 46° S., and long. 102° 10'—125° 37' E. It is bounded on the north by the Sea of Java, on the E. by the Strait of Balu, on the S. by the Indian Ocean, and on the W. by the Strait of Sunda. The extreme length from east to west is 666 miles, the breadth varies from 56 to 130 miles, and the superficial area is 50,269 square miles. The island is hilly, and cut in many parts by deep gorges and rushing streams. The mountains rise to a height of from 4000 to 10,000 feet, and are clothed to their summits with luxuriant forest. Thirty-six of the islands are volcanoes, of which eleven are still active.

In 1837, the population of J. and Madura (q.v.) amounted to 11,594,158, having more than doubled in 20 years. The census gave 29,351 Europeans, 138,356 Chinese, and 24,615 Arabsians and other Orientals. The native Javanese belong to the great Malay (q.v.) race, and are mostly Mohammedans; the remainder being 'heathen,' whose religion is a degraded superstition. In moral habits and civilization, the Javanese are superior to the inhabitants of Sumatra and Celebes. There are 29 Dutch Protestant, and 10 Roman Catholic clergymen, all paid by the government, which fixes their sphere of labours and education. They chiefly labour among the Eastern, half castes, and intermediate races at the ports, and the natives of the interior are neither made acquainted with the Christian religion nor with European education. The Javanese are much addicted to the smoking of opium, which is not permitted to be grown on the island, the government importing the quantity considered necessary, and granting licences for its sale, realising therefrom an average annual revenue of £9,000,000 sterling.

For upwards of thirty years, J. has been steadily advancing in prosperity. Its producing power is only limited by the amount of available labour, and notwithstanding the energy which the banana is displayed in increasing the breadth of cultivated land, the greatest part of the island is still in a state of nature. Rice is grown extensively for native consumption and exportation; sugar, coffee, indigo, tea, cotton, &c., are produced. The manufacture in the trade of J. has been great and rapid. In 1848, the imports amounted to the value of £2,666,765; the exports to £4,510,472. In 1860, the imports had risen to £5,894,020; the exports to £9,751,800.

The countries which trade most extensively with J. are the Netherlands, Great Britain, China, and Japan. In the trade reports for 1860, Holland is set down as having imported into J. merchandise to the value of £1,864,740, and specie to the value of £1,511,854; while Great Britain sent goods to the value of £991,155. In the same year, the exports of J. to Holland amounted to £56,663,653, and those to Great Britain to £59,135. In 1861, the exports from Great Britain to J. amounted to £1,091,511, but in 1862 had fallen to £777,400. This great difference arises from the largest proportion of the island being under the government's control, and even the land itself being owned by the government, and being managed, stored, shipped (exclusively in Dutch ships), and sold in Holland by the Netherlands Trading Company, whose profits arise from the commission allowed on the transactions. The import and export duties are very high, but are much modified in favour of the Netherlands. The leading articles imported into J. are cotton and linen goods, wine and spirits, machinery, provisions, &c.; the principal exports are sugar, coffee, indigo, tea, rice, &c. In 1860, sugar was exported to the value of £2,751,998; coffee, £2,535,380; indigo, £293,363; rice, £662,185. Some years, the exports of these articles reach a considerably higher figure.

The island is divided into East, West, and Middle Java, containing 22 subdivisions, called Residencies, over which a superior European official, the Resident, exercises general control, and acts as judge, collector, and magistrate. The Resident has Executive assistants, who perform the same functions in districts of the residency, and native agency is also extensively employed in the government service, all the chiefs being either present or expected salaried servants of the colonial government, actually engaged, under European superintendence, in ruling the masses. The chief native official of a district is the Regent, selected from the family of the former local prince, and retained in office so long as he promotes the interests of the government.

The material prosperity of J. is owing in a great measure to the energy with which the Dutch government has extended the growth and manufacture of those articles which form its staple exports. A long and skillful worked out system of culture, introduced in 1830, the growth and preparation of the staples for exportation have advanced with amazing rapidity. The cultivators of the soil, the native chiefs, the European officials, and the government all share in the profits, and work harmoniously together in developing the capabilities of the land. In carrying out the extensive mercantile transactions which the culture-system involved, the government has been ably assisted by the Netherlands Trading Company, and the result has been the changing a bimbo-some colony into a mine of wealth. Between 1824 and 1833, the expenditure exceeded the income. From that time, the finances of J. have been prosperous, and the colony has transmitted to the Netherlands, since 1838, a sum not short of £30,000,000 sterling. In thirty years, the revenue has risen from an average of £2,500,000 sterling, to £9,500,000 in 1857, in which year the net surplus was £3,500,000.

Climate.—With the exception of some marshy districts on the north coast, the climate of J. is healthy and pleasant. On the coasts, the thermometer seldom indicates more than 90° F. during the dry, and 84° in the rainy season. The average is 80° at noon, and 70° in the evening. The heat is moderated by the sea-breezes, which constantly blow across the island. During the rainy season, which begins in November and continues till March, the west wind prevails; in the dry season, it blows from the north and east. Along the high lands of the interior the air is not only breezy, but sometimes cold, the thermometer frequently falling to 47°;
and as the entire island is intersected with excellent roads, it is not difficult to reach the most beautiful and salubrious districts. Inland of Semenang, at an elevation of 1500 feet, Europeans enjoy a pleasant retreat during the dry season.

**History.**—The history of J., previous to the 14th c., is involved in fable and obscurity. It appears, however, that the Javanese, from a very early period, possessed a considerable degree of civilisation, which was probably the result of the labours of Brahmanical teachers from Hindustan. It is impossible to say precisely when Hindu civilisation and religion were introduced into J., though it must have been very early in the Christian era. Buddhism was supplanted about the 10th c.; and there are many old Buddhist temples scattered throughout the island, memorials of the former prevalence of that religion. The most famous is that called Boro Budor (q. v.). Towards the close of the 14th c., Mohammedanism found a footing in the eastern provinces; and in 1475, the Hindu empire was overthrown, and Mohammedanism became the faith of the country; yet as late as 1511, when the Portuguese first visited J., they found a Hindu king in Bantam. In 1595, the Dutch sent out an expedition under Houtman, who, on arriving at Bantam, found the king at war with the Portuguese, and offered him assistance, obtaining in return permission to establish a factory. In 1608, after many contests with the native princes, the Dutch obtained extensive territories and important trading concessions. In 1811, when Holland became incorporated with France, the British took possession of J., which, after five years' occupation, was restored to the Dutch. A long and bloody war ended in the whole island becoming virtually a Dutch province in 1830, though two states are still nominally ruled by native princes, the Cary and Banyunegar, established in the island on September 20, 1859, by the legislature of Holland. —See Sir Stamford Raffles's *History of Java* (2 vols. London, 1817); Crawford's *Eastern Archipelago; Java, or How to Manage a Colony*, by J. W. B. Money (London, Hurst and Blackett); and the annual official Reports on Java and Madura.

**Javelin.** A short and light spear used for darting against an enemy. In the Roman legion, the first and second lines (the Hastati and the Principes) were both armed with two javelins to each man: the javelin (Ligatun) was in all about 6½ feet in length; the shaft 4½ feet long, of tough wood, an inch in diameter; and the remainder given to the barbed pyramidal head. In action, the legionary hurled one javelin on the enemy at the first onset; the second he retained as a defence against cavalry. The Goths and other barbarians used a javelin.

**Jaxartes,** now called *Shyn,* or *Sir-Daria* (i. e. Yellow River), a river of Turkestan, which rises in the high plateau south of Lake Issikul, in the Thian Shan Mountains, flows in a westerly direction through the valley of Khokan, receiving in its course numerous ascensions; after passing Otrar, it divides into two branches; the largest and most northerly retaining the name Sir-Daria, flows west-by-north, separating the Russian territory from the steppes of Turkestan, and, after a course of 1150 miles, falls into the Sea of Aral; the lesser branch, called Kuvan-Daria, flows westward, supplying some small lakes in the line of its old channel; but for several years back has not reached the Sea of Aral, though sixty years ago it had a greater volume of water than the Sir-Daria.

**JAY,** John, an American statesman and jurist, and first chief-justice of the supreme court of the United States, was born in the city of New York, December 12, 1745. He graduated at King's College, New York, in 1764, and was admitted to the bar in 1768. He took a moderate and conciliatory part in the American Revolution, was a member of the Congress of Philadelphia, was president of Congress in 1778, and minister to Spain in 1779. He was very influential in negotiating the treaty of peace, and it was, according to Lord St. Helens, 'not only chiefly, but wholly by his means that it was brought to a successful conclusion.' He wrote a portion of the *Federalist*. His services to the Federal party were deemed so great, that Washington offered him his choice of the offices in his gift, and he selected that of chief-justice. He resigned, and became governor of New York, and in 1794, minister to England, and was accused by the Democratic party of having sold his country to England against France. On the defeat of the Federal party, he retired from public life, and lived in great seclusion, only taking part in religious, peace, temperance, and anti-slavery movements. He died at Bedford, New York, May 17, 1829.

**JAY** (*Garrulus*), a genus of the Crow family (*Corvidae*), differing from magpies chiefly in the rufous head and in the shorter neck, and in the shorter tail, or sometimes almost even tail. They are inhabitants of forests and wooded districts, chiefly in the temperate parts of Europe, Asia, and North America; and feed more on fruits and seeds than crows and magpies generally do; but they have the omnivorous character of the rest of the family, and often rob the nests of other birds, whether containing eggs or young.—The *Common J.* (*G. glandarius*) is a well-known native of England and of the south and middle of Scotland, although less common than it once was, in consequence of the incessant war which has been waged against it, both by gamekeepers and by the legislature itself; an English statute of the 17th year of George II. having empowered grand juries to offer thousand for the head of each jay, on account of alleged injury done to young trees. It is rather smaller than a jackdaw; the plumage is mostly ash-gray, finely tinged with red or purple, the quill-feathers and tail mostly black; a beautiful mottled patch on each wing rayed with bright blue, a broad moustache-like stripe of black extending for an inch from the base of the lower mandible on each side; the hindfeather is shorter, and in the shorter tail, each of which has a streak of black in the middle. Jays are most frequently seen solitary or in pairs. They build in thick trees or bushes, and their nest is a basket-like structure of small sticks, lined...
with fine roots and grasses; the eggs, five or six in number, are yellowish-white, minutely and thickly speckled with light brown. When taken young, the young of this species is excellent to eat. It is said that the "house of the house of Jedburgh" was one of the most prodigiously beautiful and amusing, and perhaps excels all other British birds in its power of imitating voices and sounds.

—The Blue J. (G. cristatus) of North America, a species abundant from the Gulf of Mexico to Canada, is smaller than the Common J.; it has a similar crest or tuft on the head, and a longer and more rounded tail. The general colour of the upper parts is bright purplish-blue; the wings and tail white, barred with black; the neck surrounded with a curved black collar. It is more gregarious than the Common J., and partially migratory.

The Canada J., or Cannon Bird (G. Canadensis), is a more northern American species. Other very beautiful species are found in the north-west of America, Mexico, and the Himalaya Mountains. They generally resemble the Common J. in their habits and manners.

JAYADEVA, the name of a celebrated Hindu poet, who, according to some, lived about the middle of the 11th, according to others, about the middle of the 16th c. after Christ. His most renowned work is the Gita-govinda, an erotic poem in honour of Krishna, an incarnation of Vishnu, and his wife Radha; it is interpreted both in a literal and mystical sense. His writings are in the Sanskrit language.

JEDBURGH, an old town, and royal and parliamentary burgh of Scotland, capital of the county of Roxburgh, is beautifully situated on the left bank of the Jed, 14 miles east-south-east of Selkirk, and 40 miles south-east of Edinburgh. The most interesting architectural feature of the town is the remains of the magnificent abbey of Austin Canons, founded by King David I. about 1130. Of this structure, the church (230 feet long) alone remains. The abbey was rifled and burned in 1522 by the Earl of Surrey, and again by the Earl of Hertford in 1544. The present jail occupies the site of an old castle in which Malcolm the Maidens died, and William the Lion, Alexander II., and other early Scottish kings frequently resided. The principal manufactures of Jedburgh are blankets, flannels, shawls, plaids, and hosiery. Pop. (1861) 4283.

Jedburgh appears in record as early as the 9th century. Between the years 829 and 854, Egred, Bishop of Lindisfarne, whose diocese then extended to the north of the Tweed, built two towns at Jedburgh. One of these is now represented by the hamlet of Old Jedburgh; the other by the town of Jedburgh, which was made a royal burgh in the reign of David I. Situated on the border, its inhabitants were a warlike race, whose slogan, 'Jeddart's here!' was a seldom long silent. Their chief weapon was the 'Jeddart axe,' or 'Jeddart staff,' a stout pole about four feet long with a steel head.

JEDDAH. See JIDDAB.

JEEJEEHOYO, SIR JAMSETJEE, a Parsee merchant-prince and philanthropist, was born of poor parents at Bombay, 15th July 1783. At an early period, he showed a great aptitude for mercantile pursuits, and in consequence, his father's death and the failure of his wife's uncle, Fransjee Nussewarjee, a Bombay merchant, took him into partnership. While still a young man, he visited most of the maritime countries of Asia, besides Egypt, Syria, and England. After he had become well known in his father's house, he acquired a wealth of which rapidly and prodigiously increased. I. kept his eye on the progress of political events in Europe; and when peace was restored there after the fall of Napoleon, the Indian trade was so much benefited that, from 1814 to 1819, the value of the imports from Europe rose from £870,000 to £3,052,000—in which increase, we are informed, the house of Sir Jamsetjee and his father-in-law enormously participated. By the year 1820, when he had completed his 20th year of business, he had amassed an immense fortune, and was universally acknowledged to be the first merchant in the East. He now began to exhibit, on a magnificent scale, his liberality of spirit and love of his fellow-creatures. His contribution to the Jamsetjee Jeejeebhoy Hospital was 160,500 rupees; his endowment of the Parsee Benevolent Institution, 440,000 rupees; the Malim Canayew, built by him, cost 2,000,000 rupees; the Dhumasalla, or Poor Asylum, 150,000 rupees; the water-works constructed by him at Poona cost 180,000 rupees; and the endowment of the Jamsetjee School of Industrial Arts, 100,000 rupees. Altogether, between the years 1822 and 1859, Sir Jamsetjee spent upwards of a quarter of a million pounds sterling in founding, endowing, or supporting undertakings of a purely benevolent character. Parsee and Christian schools alike were objects of his splendid and magnanimous beneficence. At length the fame of his munificence reached the ears of Queen Victoria, who conferred on him the honour of knighthood—the first occasion on which any Eastern personage had been so honored. The other honours followed; and in 1857, he was made a baronet of the United Kingdom. He died 15th April 1859, and was succeeded in the baronetcy by his eldest son, Cursetjee Jamsetjee Jeejeebhoy, who, in accordance with the provisions of his father's will, took his father's name.

JEFFERSON, THOMAS, third President of the United States of America, was the son of a planter, and was born at Shadwell, Albemarle County, Virginia, April 13, 1743. He studied at William and Mary's College, Williamsburg; and after leaving college, was engaged for some years in the practice of law. In 1769, he was elected to the Virginia House of Burgesses, where he joined zealously with the revolutionary party. In 1773, as member of the Assembly, he took a prominent part in the measures which resulted in the calling of the Continental Congress, to which he was sent as a delegate, where he drew up the celebrated Declaration of Independence. During the first year of this Declaration, he was governor of Virginia, and in 1781 was sent minister to France, where his manners, accomplishments, and more solid qualities did much to secure to America the powerful alliance that insured her success. Returning in 1789, he was appointed, by Washington, Secretary of State, a post due to his abilities, his influence, and his distinguished services. The Federal constitution had been adopted, and the two parties which then divided the country began to develop themselves. Washington, John Adams, Jay, and Hamilton were in favour of a strong centralised government; J. led the party in favour of states' rights, and a Federal government of restrained and co-operative powers. The first party took the name of Federalists; the latter were first called Anti-Federalists, then Republicans, and finally adopted the title first given them as a reproach, of Democrats. When Washington, having served two years of office, left the presidency, and a new election took place, the two highest candidates, as leaders of the opposing parties, were John Adams and Jefferson. Adams, having the largest vote, was declared president, while J. having the next highest number, became the vice-president, 1797. The strife of these parties culminated in 1800, when J. and Aaron Burr were elected president and vice-president, against John Adams, the Federal candidate. On entering upon the presidency, he
JEFFERSON CITY—JELATOM.

reduced the government to a republican simplicity, made few removals, and resolutely refused to appoint any of his own relatives to office, saying that he 'could find better men for every place than his own connections.' The most important act of his administration was the purchase of Louisiana from France. At the end of eight years, he retired to his residence at Monticello; but he did not retire to a repose of idleness: he kept up an immense correspondence, dispensed the hospitality of his mansion to visitors from every part of the world, and founded the university of Virginia, of which he was for many years the rector. Though born and educated in the first rank of colonial life, he was a democrat in theory and practice; he held that 'the world is governed too much,' and that that government is best which governs least. Though a large slaveholder, he laboured for the prohibition of the slave-trade, and of slavery in the territory beyond the Ohio River, and advocated emancipation in Virginia. His writings consist mostly of state papers and letters. His only literary work was his Notes on Virginia, published in 1782. He had one child, a daughter, and has numerous descendants. His death was remarkable; it occurred on the 4th of July 1836, while the nation was celebrating the thirty-ninth anniversary of the Declaration of Independence, which he had written. On the same day, and almost at the same hour, John Adams, the second president, who had signed with him the Declaration, died in New England.

JEFFERSON CITY, capital of Missouri, United States of America, on the south bank of the Missouri River, 125 miles from St Louis, with which it is connected both by the river and the Pacific Railway. It has a brisk trade with the hunters, and overland emigrants to California and Utah. The city has a state-house, governor's residence, state penitentiary, &c. Pop. in 1880, 2590.

JEFFREY, Francis, Lord, a celebrated Scottish critic and lawyer, was born in Edinburgh, 23d October 1773; studied classics, logic, and belles lettres at Glasgow and Oxford, and law at the university of his native city. In 1794, he was called to the bar. Two years before this, he had become a member of the Speculative Society (in connection with the university). J. soon became prominent among the members by the keenness and liveliness of his intellect, and the elegance of his literary taste. His progress at the bar was slow, partly on account of the antipathy which then existed to literary lawyers, and partly on account of his political opinions. Meanwhile he and several other young men then residing in Edinburgh, ambitious of finding a wider outlet for their talent than the discussions in the Speculative Society or the practice of the bar afforded, conceived the idea of starting a critical journal. The first proposer of the scheme was the Rev. Sydney Smith. The result was the establishment of the Edinburgh Review (q. v.), of which J. became editor, an office he retained till 1829. His own contributions were generally the most brilliant and attractive that appeared in its columns. On ethics, politics, and many of the questions affecting the social condition of man, he has written with much clearness, penetration, and force; but the thing on which he is said to have placed the highest value was his Treatise on Beauty (see AESTHETIC), a charming melange of criticism, desc- ription, and sentiment, but of soulful philosophic worth. After some years, J.'s practice at the bar began to increase; in jury trials, he shone to great advantage, and particularly in the trials for sedition between 1819 and 1822. In 1830, he became Lord Advocate for Scotland; and after the passing of the Reform Bill, he was returned to parliament for the city of Edinburgh, which he continued to represent 1832. He supported the Whig party in the turmoil of party politics for the duties of a judge of the Court of Session. During the latter years of his life, J. resided at Craigcrook Castle, in the county of Edinburgh, where he died, January 26, 1830. A biography of J., by his friend, Henry, Lord Cockburn (q. v.), a brother-judge of the Court of Session, was published in 2 vols. (Edin. 1832).

JEHOVAH (Heb. Yehovah; more correctly, Yahweh, Yahweh, or Yahved); in poetry, Jds; is variously derived, to be, though scholars are far from unanimous in regard to its etymology) is one of the names of God employed in the Old Testament. Its meaning—if the root be hlya—is, 'He that is,' 'the Being;' or, since the word contains all the forms of the past, present, and future tenses, 'the eternal One.' It is generally employed to express a different conception of the Deity from that which is contained in the word Elohim (q. v.). The latter appears to be the more primitive, in use before the Hebrews had attained a national existence, while Jehovah exclusively seems to denote the national God, supreme over all other deities, and who, under this name, is, according to Exodus vi. 3, the maker himself known to the patriarchs before the time of Moses. That J. is specifically the God of the Hebrews is clear from the fact, that the heathen deities never receive this name; they are always spoken of as Je; Moreover, the altar, the sacrifices, the festivals, the tabernacle, the temple, the priesthood, and the prophets, all belong emphatically to Jehovah. Gideon shouts, 'The sword of Jehovah and of Gideon,' as a Roman warrior would have invoked the blessing of Jupiter. In one sense, it is less broad and universal in its application than Elohim, who, in the first verse of the Bible, appears as the creator of heaven and earth, and who is God over all, irrespective of nations; but in another sense, he distinctly indicates an advantage in the same conception. While Elohim is introduced more as an Almighty Creative Power than a 'Being,' J. is God in full personal relation to man—he speaks to his creatures, makes covenants with them, hears and grants their prayers, and dotes and forgives, and deprives them of heaven and earth. The Hebrew writers even run their representations of the Divine personality into what seems to us the extreme forms of anthropomorphism. Deep reverence for the Deity and for the Divine name has led the Jewish church to the substitution of Adonai (Lord) in the pronunciation of J., the latter being vowelless by the Masoreths like the former.

A very nice and difficult controversy with respect to the authorship and unity of the Pentateuch, has long been carried on among scholars in connection with these two names. See GENESIS and PENTATEUCH.

JELALABAD, a town of Afghanistan, stands near the Cabul, in a fertile plain, which is separated from Peshawur by the famous Khyber Pass. It thus occupies a commanding position on the grand route between India and Central Asia. Pop. about 3000. The place acquired an historical interest during the Afghan wars, having been heroically held by Sir Robert Sale (1841—1842), notwithstanding the fatal disasters of the first expedition, till it was relieved by the triumphant advance of the second. See AFGHANISTAN.

JELATOM, JELATINA, or ELATMA, a town of Russia, in the government of Tavaria, is about 150 miles north of the town of that name, or the
left bank of the Oka. Woollen cloths, vitriol, and sulphur are here manufactured. Pop. 6000.

JELEITZ, a town of Russia, in the government of Kishinev, situated 110 miles east-southeast of the town of that name, on the Sona. In the vicinity are extensive iron-mines, and the town has become famous for its wheat flour, which is exported throughout the whole of Russia. Pop. 22,090.

JELLACHICH DE BUZIM, JOSEPH, BARON, a distinguished Austrian general, and Ban of Croatia, was born at Peterwardein in 1801. His father, the descendant of an old Croatian family, was a general in the Austrian service, and attained some celebrity in the Turkish wars, and in those of the French Revolution. The present ban was early employed in military service on the Turkish frontier, and distinguished himself by his courage and skill. He succeeded also in winning in a high degree the confidence of the Croatians, so that in 1848 the court of Vienna was glad to appoint him Ban of Croatia, in order to secure the support of the Slavonian Croatians against the Magyars of Hungary, and he took a very active part in the suppression of the Hungarian insurrection, not only by galvanizing for government and military command, but also for poetry. A collection of his poems was published at Vienna in 1850.

JELUM. See JELUIM.

JEMAPPES, a village (pop. about 5000) not far from Mons, in the Belgian province of Hainault, which he acquired an heroic celebrity from the victory won here by the French republicans, 40,000 strong, under Dumouriez, on 6th November 1792, over the Austrians, who were in nearly equal force. By this victory, the way into Belgium was opened to the French, and the spirit of the armed and of the people greatly elevated by the first great victory of their raw levies over the disciplined and experienced Austrian troops.

JEWA, a town in the grand duchy of Saxe-Weimar-Eisenach, and formerly the capital of the duchy of Saxe-Jena, is most beautifully situated in a romantic valley at the confluence of the Leutra with the Saale. Pop. 6500. It derives its celebrity chiefly from its university, but also from the great battle fought here between the French and the Prussians. — The University of Jena was founded about the year 1547 by the Elector John Frederick of Saxony, who intended it to supply the place of the University of Wittenberg, as a seat of learning and of evangelical doctrine. It soon acquired a high reputation. The imperial authorization was obtained, after some delay and difficulty, in 1558. It is the university of all the Saxon states, and is supported by contributions from them all. Its revenues amount to 40,000 thalers (25793 sterling). The most flourishing period of the university was that of Duke Karl August, a zealous patron of art and science, 1787-1806 A.D. To have obtained academic honours in J. is no small recommendation to employment in other German universities, and many of the most distinguished orators of other universities have been students of this. Some of its professors were among the first and most successful of the new schools; the name of Kant, Fichte founded a new school of philosophy here in 1794, and the names of Schelling and Hegel are also connected with Jena. The brothers Schlegel, von Fries, Kracauer, and Oken, have added to its celebrity in literature and science. The faculty of medicine, as well as those of theology and law, has reckoned many distinguished names. The most eminent theologians, however, have been of the most extreme rationalist school; the name of Paulus may be mentioned as a sufficient example.

In 1855, the number of professors and teachers was 67; of students, 380; and there are about 24 ordinary professors.

The great battle of Jena was fought in the vicinity of the town on 14th October 1806. The Prussian army, numbering about 70,000 men, was under the command of the aged Duke of Brunswick; while the French, commanded by Napoleon, amounted to 90,000. The former were completely defeated. On the same day with the battle of Jena, Davoust won the battle of Auerstadt, with 30,000 French defeating 80,000 Prussians, and the two battles decided for a number of years the fate of the Prussian kingdom and of the north of Germany. The loss of the Prussians on that eventful day and in the conflicts of the preceding days amounted to 50,000 killed, wounded, and prisoners, besides the loss sustained by the Saxons, their allies. The French gave out their loss to be 7000, including 270 officers.

JENNER, EDWARD, the discoverer of vaccination, was born at Berkeley, in Gloucestershire, on the 17th of May 1749, and was the third son of the Rev. Stephen Jenner, vicar of the parish, and rector of Rockhampton. His scholastic education was finished, he was removed to Siidbury, near Bristol, in order to be instructed in the elements of surgery and pharmacy by Mr. Ludlow, an eminent surgeon; in due time he proceeded to London, in the 21st year of his age, to prosecute his professional studies under the direction and instruction of the celebrated John Hunter (q.v.), in whose family he resided for two years. Under Hunter’s superintendence, he became an expert anatomist, a sound pathologist, a careful experimenter, and a good naturalist. The influence of both the master and the master’s writings had a profound effect on his mind; and Hunter’s letters, which J. carefully preserved, evince the affectionate feeling and community of tastes which subsisted between them. On leaving London, J. settled at Berkeley, where his sound professional knowledge and kindly disposition soon acquired for him a large amount of practice. In 1788, his well-known memoir, On the Natural History of the Cuckoo, appeared in the Transactions of the Royal Society, containing the results of investigations begun the previous year, and which 10 years afterwards, the fatigues of general practice having become irksome to him, he resolved to confine himself to medicine, and with that view he obtained the degree of M.D. from the university of St. Andrews.

The discovery of the prophylactic power of vaccination, by which the name of J. has become immortalized, was the result of a prolonged series of observations and experiments. His attention, whilst he was yet a youth, was forcibly attracted to the nature of cow-pox in the following manner. He was pursuing his professional education in the house of his master at Siidbury, when a young country-woman came to seek advice. The subject of small-pox being mentioned in her presence, she observed: ‘I cannot take that disease, for I have had cow-pox.’ This was before the year 1770. It was not till 1775 that, after his return to Gloucestershire, he had an opportunity of testing the truth of the traditions respecting cow-pox; and it was five years later before he began clearly to see his way to the great discovery that was to store for him. In the month of May 1780, while riding with his friend Edward Gardner, on the road between Gloucester and Bristol, ‘he went over the natural history of cow-pox; stated his opinion as to the origin of this affection from the heel of the horse [when suffering from the great pox], and speculated on the different sorts of disease which attacked the milkers.
where they handled infected cows; dwelt upon that variety which afforded protection against small-pox; and with deep and anxious emotion, mentioned his hope of being able to propagate that variety from one human being to another, till he had disseminated the practice all over the globe, to the total extinc-
tion of small-pox.'—Baron's Life of Jenner, p. 128.
Many investigations regarding the different varieties of cow-pox, &c., delayed the actual discovery for
no less than 16 years, when at length the crowning experiment of James Phipps (see INOCULATION)
was made on the 14th of May 1796, and J.'s task
was virtually accomplished. This experiment was
followed by many of the same kind; and in 1798
he published his first memoir, entitled An Inquiry
into the Causes and Effects of the Variola Vaccinae.
Although the evidence accumulated by J. seemed
conclusive, yet the practice met with violent opposi-
tion until a year had passed, when upwards of 70
of the principal physicians and surgeons in London
signed a declaration of their entire confidence in it.
His discovery was soon promulgated throughout the
civilised world. Honours were conferred upon him
by foreign courts, and he was elected an honorary
member of nearly all the learned societies of Europe.
Parliament voted him, in 1802, a grant of £10,000
and in 1807, a second grant of £20,000, and during
the last few years, a public statue in his honour has
been erected in the metropolis. His latter days
were passed chiefly at Berkeley and Cheltenham,
and were occupied in the dissemination and elucid-
tion of his great discovery. He died of apoplexy at
Berkeley in February 1823.

JERASH—JEREMIAH.

JERASH. See Gerasa.
JERBA. See Gerbel.

JERBOA (Dipus), a genus of rodent quadrupeds,
of the family Muridae, remarkable for the great
length of the hind-legs, and kangaroo-like power of
jumping. The fore-legs are very small, hence the
ancient Greek name dipous (two-footed). The tail is
long, cylindrical, covered with short hair, and tufted
at the end. The jerboas are inhabitants of sandy
deserts and wide grassy plains in Asia and the east
of Europe, Africa, and Australia. They are borrow-
ing animals, nocturnal, very destructive to grain and

other crops, laying up hoards for their winter use.
They take prodigious leaps when alarmed; their
fore-feet are then not used at all, but by means of the
hind-feet and the tail, they leap, although they are small animals, several yards. Their flesh is said to resemble that of the rabbit. Closely allied to the jerboas are the Gerbils (Gerbillus)
small quadrupeds, also distinguished by great length
and of kind-legs and power of leaping, inhabitants of
the warm and sandy portions of the Old World.

JEREMIAH (Heb. Yirmiyahu), a Hebrew pro-
phet, was the son of Hilkiiah, a priest of Anathoth,
a place about three miles north of Jerusalem. He
prophesied under the reigns of Josiah, Jehoah-
Zin, Josiahem, Jehoachin, and Zedekiah (625–58
b.C.), and his character and mission are clearly discernible in his writings. To him, a
man of an emphatically spiritual, truthful, self-
sacrificing nature, it was given to predict in the
unfolding of God's kingdom, and to denounce the
hypocrisy and religious conformity of the commonwealth, under the successive
weak kings, its speedy destruction. Fearful yet hopeful, he delivers his mournful messages from year to year, and battles with despairing heroism against the laws of one long martyrdom. We read of his enduring 'reproach and derision daily' (xx. 8); his townsman
of Anathoth threatened to slay him, if he did not stop prophesying (xx. 21); his own brethren,
that of the house of his father, 'dealt treacherously' with him (xii. 6); so that his spirit at times failed him. There were two political parties in Judah at this
time—in favour of a Chaldean and an Egyptian alliance respectively. Like the earlier patriots
prophets before him, he participated both at first.
The course of events, however, had necessitated a compromise, and the religious party—gradually decreasing in numbers and influence—had declared against Egypt,
and in favour of Chaldeas. King Josiah, who had
become strong at Megiddo, in the name of Esdras,
in an attempt to stop the progress of Pharaoh-Necho (669 b.C.). After this, things grew worse. The Egyptian party became predominant, and the Chaldean was forced to take a side, and become a partisan as well as a prophet. He speaks of the
king of Babylon as God's servant, and prophesies
the destruction of the temple. A cry arose from the
priesthood and the prophets for his life, and he
was saved by flight, or may have been carried into captivity; and J. urged his countrymen
to wait for the period of deliverance with religious fortitude and patience. A sudden irrup-
tion of the Egyptians into Judah, and J. was again exposed to persecution, thrown into a pit to die, and only rescued by the kindness of an Egyptian eunuch. The
 capture of Jerusalem by Nebuchadnezzar rendered the prophet's situation more tolerable. J. now
preached submission to the Chaldeans. He was
ever patronized by the conqueror, and offered a
home at Babylon, but he preferred to reside among
the wretched remnant of the people left in Judah
(xl). Intestine strifes, however, soon drove some
to take refuge in Egypt. J. was carried off along
with the exiles, and here he is believed to have died,
and his grave was long shewn at Cairo. According
to others, however, he came back to Judaea. The
writings of this prophet, dictated by him to Baruch,
have been arranged with little regard to order, and
the text is in a state of great confusion, notwith-
standing that J. himself undertook two distinct
redactions. The former exhibit great tenderness and
elegiac beauty of sentiment, but lack the sublime
grandeur of Isaiah. He often borrows largely from
his poetic predecessors. Several of the Psalms
have been attributed to him, especially by modem
critics. Hitzig numbers 54, which he believes to be
the composition of Jeremiah. There is no reason
to doubt that the Lamentations are properly ascribed
to him, while the apocryphal work of his, men-
tioned by Jerome (Matth. 27.), deserves no notice.
Among commentators may be mentioned Orosius,
Jerome, Theodoret, Oecolampadius, Sanctius, Voss, etc.
JERICO—JEROME OF PRAGUE

Michaelis, Umbreit, Henderson, Dahler, Knobel, Ewald, Hengstenberg, and Bunsen.

JERICO, once one of the most flourishing cities of Palestine, two hours' journey westward from the Jordan, and six hours north-east from Jerusalem. Westward from J. lies a vast waste of barren, stony mountains, rising in stages; but the immediate vicinity is well watered and fruitful, yielding dates, raisins, balsam, and honey, yet a favourite abode also, in early times, of poisonous snakes. The capture of J. by the Israelites on their first entry into Canaan, its destruction, and the rebuilding of it by Heel the Bethelite in the reign of Ahab, about 919 B.C. are found recorded in Josh. v.: 1 Kings xvi. 34. It appears to have been afterwards the seat of a school of prophets (2 Kings ii. 4 &c.). Hereot the Great resided in J., and beautified it. It was destroyed in the reign of Vespasian, and again rebuilt under Hadrian. In the time of the Crusades, it was repeatedly captured, and at last completely destroyed. At the present day, its place is occupied by a miserable village called Richa, or Eriha, with scarcely 200 inhabitants.

JERKED-BEEF, beef preserved by drying in the sun. It is properly called *charqui*, and, like its name, is of Chilian origin, although now made in large quantities in Monte Video, Buenos Ayres, and other places in South America, where the vast droves of cattle on the prairies are available for the purpose. The beasts are slaughtered when in good condition, and the flesh parts are dexterously pared off in such a manner as to resemble a succession of skins being taken from the same animal. These sheets of flesh, which are rarely more than an inch in thickness, being exposed to the sun, dry before decomposition commences, and in that state can be kept almost any length of time. Sometimes the charqui is dried into bricks, or rubbed with salt, before being dried. It is largely imported to Cuba, where it is called *tajajo*, for feeding the slaves. The manufacture of charqui, or jerked-beef, has been introduced into Australia, and in 1862, shipments of it were made from Victoria to the mother-country, with what success is not known.

As it contains only the nutritive matter of animal food, and only wants proper cooking to make it palatable, it may be considered as the most important article of consumption. The price is about three-halfpence or two-pence per pound.

JERKIN-HEAD, a form of roofing which is half-gable, half-hip. The gable generally goes as high as the t seas of the couples, above which the roof.

JEROME, Sr (*Eusebius Hieronymus Sophronius*), was born at Stridon, a town in the site which is now unknown, on the confines of Dalmatia and Pannonia, at some period between 331 and 345—probably nearer to the latter year. His parents were both Christians. His early education was superintended by his father, after which he studied Greek and Latin rhetoric and philosophy under *Eliaus Donatus* at Rome, where he was also admitted to the rite of baptism. After a residence in Gaul, he seems to have revisited Rome; but in 370, he had settled in Aquileia with his friend Rufinus. For some unknown reason, he suddenly went hence to the East; and after a dangerous illness at Antioch, which appears to have still further added to the religious fervour of his disposition, he retired, in 374, to the desert of Chaleia, where he spent four years in penitential exercises and in study, especially of the Hebrew language. In 379, he was ordained a priest at Antioch, after which he spent three years in Constantinople in close intimacy with Gregory of Nazianzus; and in 382 he came on a mission connected with the Meletian schism at Antioch (see *Meletius*) to Rome, where he resided, and was secretary of the pope Damascus, and where, although already engaged in his great work of the revision of the Latin version of the Bible, he attained to great popularity and influence by his sanctity, learning, and his skill in writing, in which latter, and in his plain manner, he fashioned himself up under his spiritual direction, the most remarkable of whom were the Lady Paula, and her daughter Eustochium. These ladies followed him to the Holy Land, whither he returned in 384. He permanently fixed his residence at Bethlehem in 386, the Lady Paula having founded four convents, three for nuns, and one for monks, the latter of which was governed by J. himself. It was in this period that J. undertook to select the great literary labours of his life; and it was among these solitudes, all peaceful as they might seem, that he sent forth the fiery and vehement invectives which marked not only his controversy with the heretics *Donian*, *Victorianus*, and the *Pelagian* Monophysitans, but even with his ancient ally, Rufinus (q.v.), and, although in a minor degree, with St Augustine. His conflict with the Pelagians rendering even his life insecure at Bethlehem, he was compelled to go into concealment for about two years, and when, after his return to Bethlehem in 418, he was seized with a lingering illness, which terminated in his death, September 30, 420. His original works, consisting of letters, treatises, polemical and ascetical, commentaries onScripture, and his translation and revision of former versions of the Bible, were first published by Erasmus, 9 vols. folio (Basel, 1516), and have been several times reprinted. The best editions are that of the Benedictines, 5 vols. folio (Paris, 1693—1706), and, still more, that of Vallarsi, 11 vols. (Verona, 1734—1742). St J. is universally regarded as the most learned and eloquent of the Latin Fathers. His commentaries on the Bible are especially valuable to us from the manner in which they display; but his opinions are often exaggerated and fanciful, and through his controversial writings there runs a strain of violent invective, which contrasts unfavourably with the tone of his contemporary St Augustine. See VETRONE.

JEROME OF PRAGUE, the companion of John Huss, whom he surpassed in learning and eloquence, though he was inferior in judgment and moderation, was born at Prague in the latter half of the 14th century. After attending the university of his native town, he continued his studies at Paris, Cologne, Oxford, and Heidelberg, and in 1399 took out his degree as Master of Arts and Bachelor of Theology. His reputation for learning was so great, that his advice was taken by Ladislas II., king of Poland, with respect to the founding of the university of Cracow in 1410; and Sigismund, king of Hungary, invited him to preach before him at Buda. He entered with his whole soul into the contest as a priest at Antioch, after having spent three years of the hierarchy and the profanity of the clergy. His zeal, however, carried him too far; he publicly trampled the relics under his feet, committed to prison the monks who did not share his opinions, and even ordered one of them to be thrown into the Mohau. When Huss was arrested at Constance, J. hastened to defend him; but receiving no satisfactory answer to a letter in which he had demanded a safe-conduct from the council, he set out on
his return to Prague, when he was arrested at Hirschau, in April 1415, by the orders of the Duke of Sulzbach, and conveyed in chains to Constance. He was first tried by a dungeon and placed on trial. After a month's imprisonment, he recanted his opinions, but subsequently absolved his recantation with horror, and went to the stake with great firmness. He was burned alive, 30th May 1416. J.'s life has been written by Heller (Tubingen, 1835) and by Becker (Nordlingen, 1858).

J.ERROLD, DOUGLAS, dramatist, journalist, and miscellaneous writer, was born in London on the 5th January 1853. His early efforts in literature were directed to the stage, and some of his pieces,—

"Black-eyed Susan" (1829), for instance,—still hold possession of the stage. At a later period, he produced several five-act comédies, the best known of which are "Tunst Works Wonders," and "The Bubbles of a Day." J.'s reputation stands more securely on his novels, sketches, and essays than on his dramatic works. His "Men of Character" was originally published in Blackwood's. He joined the staff of Punch (1841), and contributed to that periodical, "A Story of a Feather," Punch's Letters to his Son, and the world-famous Caudle Lectures. Later appeared "The Chronicles of Cowlernow," the kindest and most delightful of all his books, and "St. Giles and St. James." A new elaborate novel, several years before his death, he edited Lloyd's "Weekly Newspaper." He died from disease of the heart at Kilburn Priory, at the age of 55.

J. was a brilliant rather than a great man of letters. His plays are sparkling, but they want body and substance, and uninteresting matter had never perhaps so epigrammatic a setting as in his novels and tales. His reputation as a social wit stands higher than his reputation as a writer. He was a trader; he had a society of his own, and he could recant like a fiend. Every stroke brought fire from him. See "Life and Remains of Douglas Jerrold, and Douglas Jerrold's Wit and Humour," both by his son, William Blanchard Jerrold (Loul, 1855). J.ERSEY—THE CHANNEL ISLANDS. J. is the chief of the group called the Channel Islands (q. v.). The other inhabited islands of this group are Guernsey, Alderney, Sark, Herm, and Jethou, and there are numerous uninhabited islets and rocks. Jethou is very dangerous, and light-houses are placed on most of the island headlands, and on the dangerous rocks called the Casquets, west of Alderney, a triple light is exhibited. The Chaussey Islands belong to France. The following table exhibits the area and population of the principal islands:

Physical Geography—Description.—J., which lies 17 miles south-west of Guernsey, and 16 miles from the coast of France, is of an oblong form, about 10 miles in length and 6 in width. The land is high on the north coast, and slopes to the south and east. It is intersected by several small streams. The coast is indented by large open bays on the west, south, and east; but on the north, by small rocky inlets. The interior is mostly table-land, well wooded, especially in the valleys along the winding streams. J. is divided into 12 parishes. The church has a lofty architectural pretension, and is generally picturesquely situated. The principal town is St. Helier (q. v.). The small neat town of St. Aubin lies at the western extremity of the bay of that name. It possesses a diminutive harbour and castle, a good grammar-school, and extensive vineries. Mont Orgueil Castle is a grand and imposing medieval fortress, looking over Gorey Harbour. Some parts of it are said to be of the time of Julius Cæsar, and are inhabited by the Prymnes and the Parliamentarians, and has been used as a barracks. A good view of the island may be obtained from Howe's Bay, or Prince's Tower, a building raised on a mound of legendary interest.

ALDERNEY AND GUERNSEY are described elsewhere (see those heads).

SARK (Sercy, Gera). Great and Little Sark are one island, connected by a natural causeway called the Causey. They are lofty table-lands, with precipitous sides. The total length of the islands and rocks is about five miles: the greatest width, including Brechou and the Burons, about three miles. Sark is eight miles from Guernsey. The principal objects of interest are the pierced rocks, caverns, and basins. The caves are very rich in zoophytes. The signal is the Rev. W. Collings, who resides on the island. There is one parish church, and a lodging-house for visitors, etc. The coast is not very difficult of access, the only entrance to the interior being through a crouch or tunnel cut in the rock.

Geology.—Most of the islands are composed of primary or granitic rocks. Alderney is a mass of syenite, with porphyry, and sandstone. The structure of Guernsey is hard syenite to the north, and gneiss to the south. The geology of Jersey is more varied, presenting a mixture of metamorphic rocks, conglomerates, and sandstones. The granite of Guernsey and blonde and blown sand are also prevalent. Sark is composed of very hard syenite, with veins of greenstone and felspar. granite is quarried from all the islands, especially from Guernsey, Herm, and Mount Mado in Jersey, both for lime use and exportation.

The scenery of the Channel Islands is exquisitely varied and beautiful; probably in no other area of similar size could be found such a combination of savage rock and pleasing landscape.

The climate of the Channel Islands is agreeable and suitable to invalids. The prevailing winds are from north and north-west. The mean annual rainfall is 35 inches in Guernsey; but the climate is not only very dry, but the soil being peaty, evaporation rapid. The mean annual temperature of Jersey is 50°-8; of Guernsey, 51°-5, or 2°-5 warmer than Greenwich. The range of temperature is very moderate; but the climate of Guernsey is rather more equable than that of Jersey. August is the hottest month; February, the coldest. Frost and snow are rare. The autumns are very beautiful; and a second summer, called the Petit Été de Saint Martin, generally sets in about the 10th of October, and lasts till the middle of December. Flowering plants and shrubs are a fortnight earlier in the spring than in England.

The produce of the islands is principally agricultural; but horticulture and floriculture are successfully followed—the latter especially in Guernsey. The soil is generally light, deep, and fertile. The system of cultivation is very primitive. The principal manure is sea-weed, which is gathered in vast quantities from the shores, at certain seasons, under strict regulations. Its annual value to Guernsey alone is estimated at £30,000. A great quantity is burned for the manufacture of kelp and iodine.

The land is held in small parcels ranging from five to twenty English acres. The crops are hay, wheat, turnips, potatoes, mangel-wurzel, etc.
Jersey: The Channel Islands

parsnips, and carrots. The yield of wheat is upwards of 30 bushels to the acre—the average of England being 24. The Channel Islands possess an excellent breed of horned cattle, usually known as Alderneys, remarkable for their small size and symmetry, and for the quantity and quality of the milk which they yield. From 16 to 17 pounds of butter are sometimes obtained weekly from the milk of one cow. Carrots, potatoes, turnips, artichokes, and cauliflower are extensively cultivated in Jersey, especially the vine, the peach, apricot, plum, apple; and the pear, particularly the Chan- montel, attains extraordinary size and flavour in Guernsey. About 30,000 bushes of table-fruits are annually exported from the islands to London and Paris. Shrubs and flowers flourish abundantly.

The Acclimatisation Society of London receive favourable accounts from the Guernsey branch of the successful cultivation of T. Brannan, for the manufacture of arrow-root, the produce being very large and profitable. Vegetables are plentiful; and the cow-cabbage grows to the height of ten or twelve feet. The other products of the islands are particularly fis., viz., tarot, red mullet, John Dory, conger, laungs or sand-eels, also lobsters and oysters, large quantities of which are exported. A considerable traffic is carried on in granite from all the islands; the blue granite from Guernsey for macadamising, and the pink granite from the Island of Mado, in Jersey, for paving purposes, are highly esteemed, and largely imported into London. In 1861, 731 vessels left the harbour of St Sampson in Guernsey, carrying 142,866 tons of stone.

The Secretary of the Jersey Acclimatisation Society is a very active officer in the art of introducing new plants into the island. The Channel Islands is mythical and legendary; but it is probable that the earliest inhabitants were Bretons. The islands were under Roman occupation during the 3rd and 4th centuries, the name of Cesar's Isle occurring in the Itinerary of the Antonines. Christianity was probably introduced by missionaries from Ireland about 460 A.D.—St Helier being the traditional apostle of Jersey, and St Sampson of Guernsey. Probably a mixed population of Saxons, Danes, Goths, and Gauls betook themselves to these islands during succeeding centuries, as the Franks possessed the continent. The islands were taken possession of by Rolf or Rollon in 898, who founded the Norman dynasty. After the Norman Conquest, the islands were alternately English, under William the Conqueror; Norman, under Rufus; English, under Henry I.; and Normam again, under Stephen. With Henry II., the long reign of the Angevin dynasty, the islands, except Jersey, were of Norman origin, and were considered as sovereign of Normandy as well as England; and after the loss of Normandy, the islands still remained faithful to England. John is said to have given a constitution to Guernsey. The islands still belonged ecclesiastically to Normandy, the Bishop of Coutances being their diocesan. Edward III. and Henry V. materially weakened the papal bond; but it was not wholly severed till the Reformation, after which (in 1539) they were attached to the see of Winchester. In Henry VI.'s time, the French held Jersey for six years. During the civil war, Jersey was loyal and Episcopd; Guernsey, republican and Presbyterian; and an excellent level of horsemanship is still to be found. In 1781, during the first American war, a French expedition, under the Baron de Rullecourt, landed in Grouville Bay, and marched into the market-place of St Helier, but was repulsed, with loss, by the garrison and militia. During the French and American wars, the islanders fitted out many privateers, and obtained rich prizes. Smuggling was finally suppressed in 1800. Since the peace, the Channel Islands have been secured by commerce and agriculture, and especially by forming the resort of numerous families from England, who have been attracted thither by the beauty of the scenery or the salubrity of the climate.

Antiquities.—Formerly, there were many cromlechs in the islands; the largest remaining are those near Mont Orgueil in Jersey, and at L'Ancresse Bay in Guernsey. A few old chapels of Norman architecture remain. The oldest church in Jersey is that of St Brelade, said to have been built in 1111.

Language.—The vernacular language of the islands is the old Norman-French. It retains its peculiarities of spelling and pronunciation in Guernsey more than in Jersey, where the French, and in Alderney, where the English element predominates in the dialect. French, however, is the language used in the law-courts of all the islands; but English authors may address the jury in examining witnesses in English. The church services are performed in French in the country parishes, but an English service takes place in most of the town churches.

Inhabitants.—The proportion of strangers in Jersey is very large, British being about 13,000; French 2091; the native population about 41,000, nearly all of whom live in the country. The natives are generally frugal and independent. Society is much divided into cliques; the 'sixties' and 'forties' in Guernsey are highly marked divisions of the community.

Government and Laws.—Though belonging to the British crown, the islands have a certain independent status and action. The principal officer in each island is the lieutenant-governor, who is a general and supreme officer, and judge of all civil and criminal matters; but he has also certain civil and municipal duties. In Jersey especially, his civil jurisdiction is very extensive. He continues in office five years.

The bailiffs are in the first civil division in each island. He is also appointed by the crown, generally for life. He presides at the royal court, and has a casting vote in civil and criminal cases. He originates all measures proposed to the states, and represents the crown in all civil matters. The jurors are twelve in number, elected in Jersey by suffrage of ratepayers, for life. They sit in all the courts, and have a voice in all deliberations: in Guernsey, they are elected by the elective states.

The returns of the different parishes have also a seat in all councils: in Guernsey, however, only eight out of ten have a vote. Besides these officers, there are an attorney and a solicitor general in each island, and a high-sheriff, called in Jersey the coroner, and in Guernsey, the adjutant general.

The other members of the 'states' or assemblies are, in Jersey, the constables of the 12 parishes and the 14 deputies of the crouniers, who are elected from the reeunions of each parish. The royal court on each island consists of the bailiff and jurors. The 'states,' not convivial, without the consent of the governor, pass ordinances, which are in force for three years; laws intended to be permanent must be submitted to the sovereign. The lieutenant-governor has a veto on all questions deliberated.

In Guernsey, the 'Deliberative States' consist nearly of the same body, but there are also the 'Eleective States,' a more popular assembly, amounting to 222 persons. The governor is of the rank of a denouleur, elected by the ratepayers of the various parishes. The denoueurs (originally 12 from each parish) are the managers of all parish matters, and elected for life. The bailiff presides. The lieutenant-governor has no veto, and ordinances passed take effect without the royal approval. The proceedings of the states relate to the internal administration of the islands.

Alderney and Sark, though possessing courts of their own, and jurisdiction in petty offices, are,
with the smaller adjacent islands, under the bailiwick of Guernsey.

The isles of the islands are very peculiar, being mainly derived from the ancient customary law of Normandy. The laws relating to property are singular: arrest takes place in Jersey without proof or affidavit. Until recently, the Queen's writ had no power in the islands, and the Act of Habens Corae of 1765 has been adhered to. Interstate agreements on property are sometimes met by a curious appeal called 'Ha! Ro! à l'aide, mon Prince!' repeated thrice. It is considered to be the remains of an old appeal to Roll, Duke of Normandy, and is still a valid form of injunction.

Ecclesiastical State.—There is a dean in each island. The livings are in the gift of the crown, and of small value. The principal educational establishments are Victoria College in Jersey, and Elizabeth College in Guernsey. In both, a first-class education is given on very moderate terms, by an excellent staff of teachers, and they have various exhibitions at the universities of Oxford and Cambridge.

There is regular steam-communication between England and the Channel Islands, also between Jersey and the French ports of Granville and St Malo; and in summer there is generally an excursion-boat once a week to Sark and Herm.

The islands are protected by numerous forts, especially about the harbour of refuge in Alderney.

Books of Reference.—The principal historical authorities are the Rev. P. Falle's History of Jersey; Mr Duncan's and Mr F. B. Tupper's History of Jersey; and F. Hall, for the agriculture of the islands. The most recent and comprehensive work is The Channel Islands, by D. T. Anstel, M.A., F.R.S., and R. C. Latham, M.A., M.D., F.R.S., &c. (London 1862).

JERSEY CITY, a city in New Jersey, United States of America, on the west bank of the Hudson River, opposite New York, of which it is, in fact, though in another state, an extension, and to which it is united by large and powerful steam ferry-boats, lighted with gas, which ply night and day. It is the entrepot of the Cunard steamers, and the terminus of the New York and Philadelphia, Erie, Easton, Morris and Essex, and Northern Railways, and of a canal for coal-transport. It has manufactures of locomotives, machinery, glass, crucibles, and about twenty churches, the finest of which once stood in Wall Street, New York, but was removed, and built up, stone by stone, in this city. Pop. in 1830, 11,473; in 1860, 29,226.

JERUSALEM (Heb. Yerushalaim, Gr. Hierosulæum, Lat. Hierosolyma; called also in Arabic El-Kuds or El-Koda, 'the Holy'), the Jewish capital of Palestine. Its origin and early history are very obscure. Josephus (Antiq. i. 1. 2) identifies it with the 'Samel' of which Melchizedek (Gen. xiv. 18) is called king; but St Jerome doubts the correctness of this view. Critics are better agreed as to the identity of J. with Jebusi, the city of the Jebusites (Josh. xviii. 28), and we know that the Jebusites retained possession of the strong positions of the hill of Zion for a long time after the destruction of Jerusalem, and even after the storming of J. (Jud. i. 8), while the tribes of Judah and Benjamin occupied the lower city. They were finally dispossessed by David (2 Kings v. 7). The name J. is first mentioned in Jo. It lies upon the line of border between Judah and Benjamin, the line of which runs through the valley of Hinnom; so that Zion and the northern city lay within the territory of Benjamin. Its historical importance dates from the time of David, who there fixed his residence, calling it by the name of the 'City of David,' transporting to it the ark of the covenant, and building in it an altar to the Lord, on the place of the apparition of the angel by which the plague was stayed (2 Kings xxiv. 25). The building of the temple under Solomon was the consummation of the dignity and holiness of J., which was further enlarged, strengthened, and beautified by this king and by his successors. It is important to note the role of Zosimus, a Persian priest, in the restoration and enlargement of the temple, and the importance through the revolt and secession of the Ten Tribes, from which date its history is identified with that of the kingdom of Judah. It was pillaged in 733 B.C. by Sargon (Shishak), king of Assyria (2 Chron. xii. 9), by Josiah king of Israel (4 Kings xiv. 13, 14); and finally (588 B.C.), it was taken, after a siege of three years, by Nabuchodonosor, who razed its walls, and destroyed the temple and built, on the north-western angle of this hill, after the Captivity (536 B.C.), it was again taken and pillaged under Ptolemy Lagos (320 B.C.), and under Antiochus Epiphanes (161 B.C.), after the well-known and mysterious repulse of Heliodorus (176 B.C.); and Pompey (63 B.C.) took the city on the anniversary of its capture by Nabuchodonosor, put 12,000 of the inhabitants to the sword, and razed the walls to the ground, sparing at the same time the treasuries of the sanctuary. However, a few years later, they were permitted (by Crassus) to rebuild the temple. Its beginnings date the continued series of Roman aggressions, which terminated in the complete destruction of the city and dispersion of the Jewish race, under Vespasian and Titus (70 A.D.). From the description of Josephus, we learn that at this period, J., which occupied the four hills Zion, Acra, Moriah, and Bezetha (separated from each other by deep valleys or gorges), consisted of three angular regions—the Upper City, the Citadel of Zion; the Lower City, which lay to the north, on the hills of Acra and Moriah; and the New City, still further to the northward. The temple stood on the hill of Moriah, and John Hyrcanus built, on the north-western angle of this hill, a fortress called Baris, which was strengthened and beautified by Herod, and called ' Antonia,' in honour of Mark Antony. Herod's own palace stood at the northern extremity of the Upper City, and on the eastern angle, built an open place, the Temple Square, surrounded by galleries, and communicating by a bridge with the temple. The environs of the city were adorned with gardens, parks, ponds, and tombs. In the progress of ages, ancient J. was surrounded by three walls and two gates. The city, in three portions of their course, is difficult to be determined, although it is upon this that the controversy as to the authentic site of the Holy Sepulchre (q. v.) mainly turns. (A plan of the city will be given along with the map of Palestine, p. 295.) The first and most ancient wall surrounded the Upper City on the hill of Zion, and joined on its northern side the praetorium of the temple. The second wall, or the wall of Excehias, enclosed the hill of Acra, around which stood the Lower City. It was connected at the south-western angle with the first wall, from which it ran in a semicircle to the north and north-east, surrounding the Upper City till it joined on the north-western angle the hill of Zion, and the third wall, built by Herod Agrippa, which enclosed the hill Bezetha and the so-called New City, appears to have started from the north-western angle of the first wall, probably at the tower called ' Hippicus,' and to have taken a northern and north-easterly direction around the New City till it met the north-eastern angle of the temple wall. It thus, for a part of its course, was external to the second wall. The site of the Church of the Holy Sepulchre and the Hill of Calvary are thus supposed, by the
defenders of their authenticity, to have been without the wall of J. as it stood in the days of our Lord—that is, the second wall, although they were taken in by the subsequent extension of the city a short time afterwards, when the third wall was built, at some distance to the west of the second, by Herod Agrippa. The investigation of the exact direction of the second wall has long been an object of desire with biblical antiquaries, and it is probable that the time and place projected or in progress will remove all uncertainty.

The city destroyed by Titus was rebuilt by Hadrian; but only as a heathen and Roman city, under the name Cæsarea Capitis-Eius, with a temple of Jupiter; not as the capital of the Jewish race, who were forbidden, under pain of death, to visit it. Constantine, under the inspiration of his mother Helen, took measures to consecrate and perpetuate its Christian memories by ascertaining the sites of the various events in the Passion of our Lord, and erecting on them churches and other suitable memorials of those scenes of the redemption of the world, which thenceforth became an object of pilgrimage. Encouraged and assisted the Jews to return and rebuild their ancient capital; an enterprise which, as the same writers—supported, in most respects, by the pagan historian Ammianus Marcellinus (xxiv. 1)—afforded a triumph of veneration for Jupiter, by the number of minarets and domes which rise above the level of the flat-roofed houses, the general appearance of the city, seen from without, is picturesque and pleasing. There are seven gates of which the principal are the Jaffa Gate, the Damascus Gate, the Stephen's Gate, and the Zion Gate. If lines be drawn between these four gates, the city will be divided into four parts, which almost coincide with the four quarters into which the population—Christian, Armenian, Jewish, and Moslem—is divided; the Christians occupying the north-west, the Armenians the south-west, the Jewish the south-east, and the Mohammedans the north-east; the portions of the city being divided into different cities, which has about 25,000—the number of the remaining half, 7500 are Christians of the various rites, the rest being Jew. To all alike, the city is the seat of many sacred associations. The Jews have seven small and mean synagogues. The Mohammedans, since the days of the first occupation, have held possession of the site of the Temple of Solomon, on which the so-called Mosque of Omar now stands; and the pasha's Sarai, or official residence, occupies the site of the Tower Antonia. The Church of the Holy Sepulchre (see Holy Places), with its enclosure, which is occupied by all the Christian communions, has been always a seat of the Latins possess, for their own worship, the Church of St Saviour; it is attached to the Franciscan convent, in which Europeans of all denominations receive ready hospitality. In like manner, the Greeks, Armenians, Syrians, Copts, and Abyssinians have convenits or hospitals appropriated to their several communions. That of the Armenians on Mount Zion is said to be one of the richest in the East; and the same communion possesses another convent on the reputed site of the house of Caiaphas. The street leading from the Eastern or Stephen's Gate to the Holy Sepulchre is called the Via Dolorosa, and is believed to follow the route of our Lord's last and second Passion (see Hall of Judgment to Mount Calvary. In other parts of the city or its immediate environs, are shown the reputed sites of the Mount of Olives, the Tomb of the Virgin, the Pool of Bethesda, the Potter's Field, and the sites of almost all the events of the Passion of our Lord or of scenes connected therewith. The authenticity of these sites has been the subject of considerable controversy in later times. See Holy Places. Beyond its religious associations, the modern city possesses few advantages. Its...
entirely without commerce; and its only branch of industry is the manufacture of beads, crucifixes, and sculptured shells, or tablets of mother-of-pearl. In these objects, an active trade is practised with the pilgrims, who number about 10,000 annually; and considerable quantities are exported to Spain, Italy, and France. The beads are either bery or are manufactured either from date-stones or from a species of hard wood called Mecca fruit. For the use of the Mohammedan pilgrims—for whom the Mosque of Omar is only inferior in sacredness to Mecca and Medina—a considerable manufacture is carried on of amulets of black stone, which are reputed to be a protection against the plague.

The city, however, did not fill the space which might at first sight be expected. When the city was rebuilt after its destruction under Titus, the new city Ælia was so inconsiderable as a Christian metropolis, that it was the suffragan of the metropolitan of Cesarea. The Council of Nice recognised a precedence of honour; but it was not till the Council of Chalcedon that the church of J. was raised to the rank of a patriarchate, with jurisdiction over all the bishops of Palestine. J., however, ranked last among the eastern patriarchates. In common with the other eastern churches, J. followed in the train of Constantiopolis in its secession from the West. The patriarch of J. was a party to the decree of union in the Council of Florence; but his flock soon fell back into schism; and although the titular rank of patriarch of J. has been maintained in Rome, the church remained under the care of the Franciscan community, and the Latin patriarch had never resided in J. until the accession of the present pope, Pius IX., by whom the duty of residence was re-established. In the year 1841, the governments of England and Prussia united for the establishment of a Protestant bishopric, the appointment of which rests alternately with England and with Prussia. See Robinson’s Biblical Researches, Stanley’s Sinai and Palestine, Williams’s Holy City, Richardson’s Travels along the Mediterranean, Ritter’s Erdkunde, Seege Forschungen eines Teutschen Reisenden; and on the Patriarchate, Wirtsch’s Kirchliche Geographie. JERUSALEM ARTICHOKE, or TOPINAM BURI (Helianthus tuberosus), a plant of the natural order Compositae, and of the same genus with the common Sunflower (q.v.), is a native of Brazil. The word Jerusalem, in the English name, is a corruption of the Italian girasole, sunflower; the name artichoke is merely from a supposed similarity of flavour in the edible part—the tuber—to the artichoke. The J. A. has straight simple stems from eight to twelve feet high, and many rough ovato acute stalked leaves; and in the end of autumn, but rarely in Scotland, produces yellow flowers resembling those of the common sunflower, but smaller. The thick, fleshy, and knotted perennial root produces, pretty closely around it, oval or roundish tubers, sometimes thirty or fifty in number, which are reddish on the outside, and whitish within, in appearance very similar to potatoes. They have a sweetish, mucilaginous taste when boiled, and are much more watery and less nourishing than potatoes. They are eaten raw, or eaten raw, when properly prepared with sauce, and make very good soup. The plant is also useful for fodder for cattle, yielded by its leaves the more tender parts of the stems. The fibre of the stems may probably be found valuable for paper-making. The stems and leaves contain much nitre, and have been used for making potash. The J. A. is scarcely an agricultural crop in Britain, although it is to some extent in some parts of Europe. It is common, however, in gardens, and was known in our gardens before the potato, to which it in some measure gave place. It is generally propagated by small tubers, or cuttings of tubers, like the potato; and its cultivation is in most respects similar, although the aspect of the plant is very different.

JERVIS, John, Earl of St Vincent, a British admiral, was born January 9, 1734. He obtained a commission in the navy as lieutenant in 1755, and in 1769 commanded the Alarms frigate in the Mediterranean. When she was paid off, he made a tour of inspection to the naval arsenals of France and Northern Europe. He was then appointed to the Foudroyant, the finest two-deck ship in the British navy, and engaging the Peggy, 74, off Bret, he took her without the loss of a man. For this gallant exploit, he was made K.C.B. In 1757, he was made rear-admiral; in 1773, he commanded the naval part of the expedition against the West India Islands, Sir C. Grey commanding the troops; and so successful was this expedition, that although the French were well prepared, and fought desperately, every island fell in succession into the hands of the British. In 1758, he received the command of the Mediterranean fleet; and here, for the first time, he made the acquaintance of Nelson, Hood, Collingwood, Halliwell, Troubridge, &c. On the 14th Feb. 1796, with only fifteen sail of the line, he fell in, off Cape St Vincent, with the Spanish fleet of twenty-seven sail. Without a moment’s hesitation, J. determined to engage the enemy; and the battle of St Vincent was fought. The genius of Nelson, however, contributed greatly to the success of the day. For this victory, the king created J. Earl St Vincent, and parliament settled upon him a pension of £3900 a year. After having, by great firmness, repelled a mutiny on Cadi, which threatened the loss of the whole fleet, he was compelled by ill health to retire home. He was soon applied to by government to subsidise the sale of soldiers who had openly manifested itself in the Channel fleet; and his endeavours were eminently successful. After having held the appointment of First Lord of the
Admiralty, and for a second time commanded the Channel fleet, he retired into private life, and died March 13, 1823. A public monument was erected to his memory in St Paul's Cathedral. History has enrolled the name of St Vincent in the rank of the eminent naval commanders who broke the maritime power of France and Spain, and established the naval supremacy of Great Britain.

JESSAMINE. See JASMINE.

JESSANT, in Heraldry, springing forth, a term frequently used as synonymous with Jessant, rising, as a demi-lion is often represented doing from the bottom line of a field, or upper line of an ordinary. Jessant is sometimes used improperly for Jeansant, of rising from the middle of an ordinary. The phrase Jessant-de-lis is used with respect to a strange heraldic device representing a leopard's head affronté with a fleur-de-lis passing through it. The family of Morely, Hants, bears sable, a leopard's head argent Jessant-de-lis; and gules, three leopards' heads Jessant-de-lis or, are the arms of the family of Canteloup.

JESSO. See JESO.

JESSORE, a town of Bengal Proper, capital of a district of the same name, is 77 miles to the north-east of Calcutta, in lat. 23° 10' N., and long. 89° 10' E. Here, in 1838, was erected, by the zemindars of the neighbourhood, a handsome and commodious school, in which instruction is given in English, Persian, and Bengal. The district of Jessore contains 3312 square miles, and about 400,000 inhabitants. Salt is obtained from the southern frontier; and sugar and rum are largely prepared from the sap of the palm-tree.

JESSULMERE, a fortified city of Rajpootana, capital of the protected state of the same name, contains about 35,000 inhabitants. It is in lat. 26° 56' N., and long. 70° 58' E., being 1290 miles to the north-west of Calcutta. It has several Jama temples, and various tanks and wells, the only sources of water-supply. The state of Jussulmure contains an area of 12,252 square miles, and about 75,000 inhabitants. The country is poor and sterile, and the public revenue is under 4000/.

JuSTIUS, or SOciETy OF JESUS, a celebrated religious order of the Roman Catholic Church, which has filled a large space in the religious and political history of the world. It was founded in 1540, by the well-known Ignatius of Loyola (see LOYOLA), in concert with five associates—Peter Le Fevre, a Savoyard; three Spaniards—James Lainez, Francis Xavier, and Nicholas Bobadilla; and a Portuguese named Rodrigo. The original object of association was limited to a pilgrimage to the Holy Land, and a mission for the conversion of infidels; but as all access to the Holy Land was precluded by the outbreak of a war with the Turks, the associates turned their thoughts to a more comprehensive organisation, specially designed to meet those more modern requirements which had arisen since the Reformation. With this view, Ignatius of Loyola, with Lainez and Le Fevre, having meanwhile recruited several new associates, repaired to Rome in 1559, and submitted to the pope, Paul III., the rule of the proposed order, the great aim of which was expressed in their adopted motto: Ad majorem Dei gloriam (To God's greater glory); and the vow of which, in addition to the threefold obligations common to all Catholic religious orders, of chastity, poverty, and obedience, comprised a fourth, whereby the members bound themselves unreservedly to go as missionaries to any country which the pope might indicate to them. The new rule was approved by a bull dated September 27, 1540; and in the following year, the association was practically inaugurated at Rome, by the election of Ignatius of Loyola as its first general.

The constitution of the society, as originally framed, has undergone various subsequent modifications that it may be described, at the outset, without specifying these changes. Although it is commonly described as absolutely monarchical, yet it is, in many respects, strictly limited. It is true that the general, who is elected by general congregations, consisting of professed members selected for the purpose by the whole body of professed members in the various provinces—holds his office for life; and although he is aided in his government by a council of five assistants from the five chief provinces, he is not obliged to follow their voice, even when unanimous. But, on the other hand, he is strictly bound by the constitutions of the order; nor, although he may dispense in particular cases, is he competent, of his own authority, to annul or to alter the general constitutions. In like manner, although no instance of deposition has ever occurred, he is liable to be deposed by the sentence of a general congregation, in certain contingencies which are specifically pointed out by the constitutions.

The body over which this general presides consists of four classes: 1. Professed, who, having passed through all preparatory stages, which commonly extend over ten or twelve years, or even a longer period, have solemnly taken the vows described above, including that of obedience to the pope. It is from this class alone that the general and all the higher officials of the society are chosen. 2. Coadjutors, spiritual and temporal: the formers, who have completed their studies, and have (seldom before their thirty-second year, or even later) been admitted to holy orders—being designed to assist the professed in preaching, teaching, and the direction of souls; the latter being lay-brothers, to whom the minor and menial offices of the society are assigned. 3. Scholastics, who, having passed through the novitiate, are engaged for a long series of years, either in pursuing their own studies, or in teaching in the various schools of the order. 4. Laymen, who, after a short trial as 'postulants' for admission, are engaged for two years exclusively in spiritual exercises, prayer, meditation, ascetic reading, or ascetic practices, and generally in a course of disciplinary training. The administrative and executive government of the society, throughout the various provinces or countries into which it is divided, is intrusted, under the general, to provincials, who are named by the general, and hold office, as do all the other officials, for three years. In each separate province, there are three kinds of communies—professed houses or residences, colleges, and novitiate. Not only the superiors of these houses— who are called by different names—but also all the various office-bearers in each, are appointed by the general, who receives at stated intervals—monthly from provinces, quarterly from colleges and novitates—a detailed report of the character, conduct, and position of each member of the society. In all these gradations the subordination is complete, and the obligation of obedience is immediate and unreserved; and one of the most familiar accusations against the society is, that this duty of blind and implicit obedience makes the superior the sole and final arbiter of conscience for all his subjects, the judge of good and evil, of virtue and of vice. Nevertheless, whatever may be said of the practical
tendency of this relation, the J. and their apologists plead that, both in the rules of St Ignatius and in the so-called 'examen' of the candidate, there is conceived, the duty of obedience to a superior, an explicit reservation for the subject, 'unless where the superior should command what is sinful.'

Such is the internal organisation of this extraordinary association. The system of training applied to the members of its society exhibits the most profound knowledge of the human heart, and the most correct appreciation of the religious instincts and impulses of mankind. The long exercises of the novitiate were designed by Ignatius to form the individual character in habits of personal holiness, and practices of personal piety. It was the business of the school and college to form the social character of the future teachers of men, and directors of the destinies of society. Being carefully adapted to the actual condition and progress of knowledge, they sought to add manners and habits calculated to inspire confidence, and to disarm pre-judice and suspicion. Unlike the older orders, they may not be paradox of a special calling, whether by a peculiar habit, or by peculiar exterior indications of austerity or asceticism. They enjoyed, indeed, in these respects, some exemptions from the more austere practices of other orders. Their churches were but designed as supplementary to those of the parish clergy (whose ordinary costume they adopted as their own conventional dress), without the canonical services, without much imposing or attractive ceremonial, being chiefly appropriated for religious instruction, and for the exercise of the confessional. Their casuistry avoided all harsh and excessive rigour; and it cannot be doubted that many members carried it to the opposite extreme. They address them to the great want of their time—education; and through the mastery which they soon obtained in this important field, as well as their eminence in every department of learning, divinity, philosophy, history, scholarship, antiquities, and letters, they attained to unbounded influence in every department of society. It may be added that to their extrao-
dinary success in thus drawing to themselves, for education, the youth of every country into which they held entrance, the history of the society ascribes much of the opposition which they encountered from the universities and collegiate bodies whose monopolies they invaded.

The organisation of the society is settled, in every important particular, by the original rules and constitutions of St Ignatius. The opponents of the J., however, allege that, in addition to these public and avowed constitutions, there exists in the society, for the guidance of their hidden actions, and for the private direction of the thoroughly initiated members, a secret code, entitled Monita Secreta (Secret Instructions), which was meant to be reserved solely for the private guidance of the more advanced members, and which was not only not to be communicated to the general body, but was to be boldly repudiated by all, should its existence at any time be suspected or discovered. This singular code, a master-piece of craft and duplicity, promulgated at Cazow, 1612, and has been repeatedly reprinted by the enemies of the J.; but it is indignantly disclaimed by the society. The accounts of the time and circumstances of its discovery are suspicious and contradictory. It has been repeatedly condemned, both at Rome and by other ecclesiastical authorities, and its apocryphal character is now commonly admitted (see Barier, Dictionnaire des Anonymes).

The history of the society is so varied in the different countries, that it is necessary, although very briefly, to allude to each separately, dividing it into three stages—the rise, the suppression, and the restoration of the order.

In Italy, its early career was brilliant and unclouded. Before the death of the first general, Ignatius, in 1556, the Italian J. had swelled to 1000 in number, and the order was established in twelve provinces. Their first check in Italy occurred in the year 1567, when the synod of Trent condemned them in their more peculiar practices. But in 1606, the alternative, proposed by the senate, of leaving the Venetian territory; nor was it till 1656 that they were re-established in Venice, from which time they continued to enjoy undisputed influence in Italy until the suppression of the order.

The earliest settlements of the J. outside of Italy were in Portugal and Spain. In 1540, Rodrigue de Searta and another Jesuit opened colleges in Portugal, at the invitation of the king. Francis Borga, Duke of Gandia, in Spain, was equally well received in his native country, where the order flourished so rapidly, that, at the time of the suppression, the Spanish J. numbered above 6000.

In France, although a house for novices was founded in Paris by St Ignatius in 1542, the university opposed their introduction as unnecessary and contrary to the principles of the Gallican liberties, and still more to the Huguenot. The jurats, the parliament, and the partisans of abolution, were alarmed by the free political opinions which found the most ready expression in the Jesuit schools. On the other hand, the democratic party attributed to them a sinister use of their influence with courts. And thus their progress was slow, and their establishment was attended with much difficulty that the parliament of Paris consented to register the royal decree which authorized their establishment. In more than one instance, the university protested against their schools as invading its privileges. In the wars of the League, they did not fail to make new enemies; and at length, the assassination of Henry III. by Clement (although no evidence of any connection with the J. appeared in his case), and the circumstance, still more singular, that the Jesuits actually urged against them; that, who attempted the life of Henry IV. had at one time been a pupil in their schools, led to their expulsion from France in 1594. They were reinstated, however, in 1603; but on the assassination of Henry IV. the order was irradiated by a new outburst of enmity against their principles and tenets. Although it seems quite certain that this clamour was utterly without foundation, yet the opinions held by one of their order, Mariana (q. v.), on the right of revolt, although condemned by the general, gave a colour to this and every similar imputation. A less deep but more permanent and formidable movement against them was gradually stirred up at a later period, by a combination of all the causes of unpopularity already described, to which a new point was given by the well-known Jansenist controversy, and by the questions as to the imputed laxity of the moral teaching of the J., and their alleged corrupt and demoralising casuistry. What was then the object of some of the Jesuit casuists was mercilessly exposed by the brilliant adversary as the authorised teaching of the order, and the crafty maxims and practices popularly ascribed to the society were placed before the world in a light at once exquisitely amusing.
and fatal to the reputation of the body. The attempts at rejoinder on the part of the J. but served to fix the ridicule more firmly. Of the thousands who laughed at the happy humour, or sympathised with the ingenious reply, a few, indeed, could plod through the heavy and pointless scholasticism of his adversaries. In vain the J. insisted that the obnoxious canards had been condemned by the society itself; in vain they sought to show that even more extraordinary. In neither America, also, the J. had extensive and highly successful missions. Above all, their establishments in the southern continent, in Brazil, in Paraguay, and Uruguay, upon the Pacific coast, in California, and the Philippine Islands, served to the arts of civilization as much as of religion; and Sir John Bowring recognised in the condition of the native population of the Philippines to the present day, the results of the sound and judicious culture of which the early Jesuit fathers laid the foundations.

In Germany, the Jesuit institute was received with general and immediate favour. In the Catholic territories, Austria, Bavaria, and the Rhenish principalities, they not only founded colleges and other establishments, but also established residences, and even episcopal sees, at Ingolstadt and other universities to hold important professorships, and received in many dioceses the charge of the episcopal seminaries then newly established. Before the death of the first general, St Ignatius, these establishments had spread from those first 26 colleges and 10 professed houses; and Lainez, the second general, was able to say that there was scarce a German town of note which had not a Jesuit college. In the mixed states, their career was not so uniform. Their great bent for a freethinking and thorough devotion to the church, made them at once eager and formidable polemics. In Hungary and Transylvania, much bitterness arose out of their introduction; the same may be said of Bohemia and Moravia; and through the whole course of the Thirty Years' War, the J., though in many instances wrongly, were regarded by the belligerent Protestants as the soul and centre of the Catholic cause.

In the Netherlands, they encountered some opposition at first; but in 1592, Lainez, the second general of the order, came to the Low Countries, and a college was opened at Louvain, which eventually became one of the greatest colleges of the order.

In the Netherlands, the Jansenistical party was less numerous and less influential than in France, and the conflict with them was less permanently prejudicial to the Jesuits. In the Protestant kingdoms, the J. obtained entrance only as missionaries, and in some, as in England, Scotland, and Ireland, under circumstances of great difficulty and peril. From England they were excluded by the penal laws under pain of death; nevertheless, were a constancy and devotedness which it is impossible not to admire, they maintained through the worst times an unbroken succession of missionaries in many parts of England. They often resorted to the use of disguises, sometimes assumed false names; and several of the old Roman Catholic mansions still shew the 'Priest-hole,' which was contrived as a retreat for them in cases of sudden emergency. Into Ireland they effected an entrance almost at the first foundation, and after many vicissitudes, towards the close of the reign of Charles II., they had more than one considerable college for the education of youth.

But a still more fertile field for the enterprise of the order was that of the missions to the heathen, in which, from their very origin, they engaged, and in which they soon attained to a success which outstripped all the older orders in the church. In the Portuguese colonies of India, that of Francis Xavier (q. v.) are well known. The results of their missions in China and Japan (see RICCI, SCHALL), though more checked by the conflict with other missionaries, were, from the character of the people, even more extraordinary. In Northern Africa, also, the J. had extensive and high successful missions. Above all, their establishments in the southern continent, in Brazil, in Paraguay, and Uruguay, upon the Pacific coast, in California, and the Philippine Islands, served as much as of religion; and Sir John Bowring recognised in the condition of the native population of the Philippines to the present day, the results of the sound and judicious culture of which the early Jesuit fathers laid the foundations

Such in its various branches was this great and wonderfully organized association in the first stage of its history. At the celebration of their first centenary jubilee in 1570, 12,112, distributed over 32 provinces. At the date of their suppression, a century later, they had increased to 22,589, and were possessed of 24 professed houses, 699 colleges, 176 seminaries, 61 novitiates, 335 missionary stations, and 177 reductions of the southern coast of America, in the exchange of tributary countries, or in the Protestant states of Europe.

The decline in the fortunes of the J., although its origin dates far back into the 17th c., was rapid and decisive in its consummation. The first blow which they sustained was in Portugal. The native Indians having resisted this transfer, the Portuguese ascribed their disaffection to the J. missionaries. The Portuguese minister, Pomal de Carvalho, to whom the J. allege that their possessions in Portugal had long been an object of desire, instituted a commission of inquiry; and while it was still pending, an attempt on the life of the king, Joseph, which, as in the similar attempts on Henry III. and Henry IV., was laid on the charge of the J., furnished him with a fresh ground of impeachment; and without waiting any juridical proof of either accusation, he issued, in September 1759, a royal decree, by which the whole order was definitively expelled from the kingdom. This example was followed in other kingdoms. In France, under the ministry of the Duke de Choiseul, the immediate occasion of the disgrace of the J. was a trial in the civil courts. Father Lavealet, as procurator of the order in the island of Martinique, had consigned to a commercial house in Marseilles two large and valuable cargoes. These cargoes having been seized by English cruisers, and Lavealet being unable to meet the bills which he had drawn upon the credit of their delivery, the Marseilles merchants proceeded against the order. The provincial parliament having decided in favour of the merchants' claim, the J. pleaded that Lavealet acted without the authority of the order, but against the positive constitutions, and appealed to the parliament of Paris against the provincial sentence. The inquiry thus raised presented an opportunity of which the ancient enemies of the order in the parliament eagerly availed themselves. A report on the constitutions of the society, highly damnable, was speedily drawn up, and a demand was made for the suppression of the order, as irreconcilable, in its
JESUITS' BARK.—JESUS.

constitution and practice, with the interests of the state and of society. A strong effort was made by the French bishops, and by Pope Clement XIII., to arrest the proceeding; but a powerful court-faction, aided by the secret influence of the royal mistress, Madame de Pompadour, who was irritated by the refusal of absolution by her Jesuit confessor unless on condition of her separating from the king, and supported in the public press by the then rising philosophes, engaged every public man, private, and public, against the Jesuits. An attempt at compromise was proposed to the general, Father Ricci, by which the obnoxious constitutions might be abolished or modified; but his uncle, a lively reply, 'Sint ut sunt, aut non sint' ('Let them be as they are, or let them cease to exist'), cut short all negotiation; and a royal edict was published in 1764, by which the society was suppressed in the French territory. This example was followed by Spain, under the ministry of Aranda, in 1767, in circumstances of great harshness and severity, and by the minor Bourbon courts of Naples, Parma, and Modena. The court of Rome had zealously but vainly endeavoured in their behalf, and during the pontificate of Clement XIII., they received from him a support only the more warm because of the hostility which they encountered elsewhere. But his successor, Clement XIV. (q. v.), inclining in after the all exclusions of the church and state, to the side of peace, having in vain endeavoured to procure from the courts by which they were condemned a relaxation of the severity, and being pressed by the vociferous representations of the French and Spanish provinces, at the beginning of 1771, the celebrated bull, 'Dominus ac Redemptor Noster,' by which, without adopting the charges made against the society, or inquiring into the question of their justice, acting by the command of the church, he suppressed the society in all the states of Christendom. The bull was put into execution without delay. In Spain and Portugal alone, the members of the society were driven into exile. In other Catholic countries, they were permitted to remain as individuals engaged in the ministry or in literary occupations; and in two kingdoms, Prussia under Frederick the Great, and Russia under Catherine, they were even permitted to retain a quasi-corporate existence as a society for educational purposes. What was meant, however, to be the suppression of the society, proved but a temporary suspension. The ex-members continued in large numbers, especially in the Papal States and Northern Italy; and soon after the lapse of the revolution, the ancient influence of the church had blown over, measures began to be taken for the restoration of the society. The first overt reorganisation of them was in 1799, in the duchy of Parma, at an inconceivable town called Colorno, in which one of the earliest novices was the afterwards celebrated Angelo Mai. This proceeding on the part of the Duke of Parma was barely tolerated by the pope; but in 1801, Pius VII. permitted the re-establishment of the society in Lithuania and White Russia, and with still more formality in Sicily in the year 1804. It was not, however, until after the restoration, and the return of Pius VII. from captivity, that the complete rehabilitation of the Jesuit order was achieved by the publication of the bull Sollicitudo Rei Ecclesiae, August 7, 1814. In the same year, they opened a novitiate at Rome; and in 1824, their ancient college, the Collegio Romano, was restored to them. In Modena, Sardinia, and Naples, they were re-established in 1815, as also in Spain, where their ancient property and possessions were restored to them. They were again suppressed by the Cortes in 1820, and again restored in 1825; but at the final change of public affairs in Spain in 1835, the J. shared the fate of the other religious establishments, which fell under the double influence of revolution and reaction. In Portugal, they have never obtained a firm footing. Dom Miguel, in 1822, issued a decree for their restoration; but almost before they had entered into possession, the order was reversed by Dom Pedro in 1833. Their position in France has been one of suffering rather than of positive authorisation; nevertheless, the Jesuits in the last five years, have acquired an influence which educational institutions hold the very highest rank. In Belgium, they established themselves after the revolution, and they now possess many large establishments suppressed among the colleges, which are very numerously attended by the Catholic youth, as well as of Belgium as of other countries. In Holland, also, they possess several considerable houses, as well as in England, Ireland, the United States, and, within a recent period, Scotland. In Switzerland, they opened in 1815 a college at Fribourg, which became a most flourishing establishment, and subsequently they extended themselves to Schwytz and Lucerne; but the war of the Sonderbund (one of which arose from the Jesuit question) ended in their expulsion from the Swiss territory. Of the German states, Bavaria and Austria tolerated their re-establishment for educational purposes. In the Italian provinces of the former, as also in the Austrian territories, they have continued to retain possession of their ancient establishments. From Sardinia, Naples, Sicily, and the annexed territories of the kingdom of Italy, they withdrew at the first indication of the change, the members of these provinces being now distributed through the houses of the order in different parts of the church. The literature of the history of the J. exists in a multitude of works on each point, but we shall only refer to the two most recent works on either side, Gioberti's Il Genio Moderno, 1847, and Cretinina's Histoire de la Compagnie de Jesus, 1845.

JESUITS' BARK. See CINONHA.

JESUS, the Greek form of the Hebrew word Yeshua, Josephus, 'Jehovah, the Saviour,' is the name given to the son of the Virgin Mary by the angels who announced his approaching birth (Matt. i. 21; Luke i. 31). The reason of the name was at the same time declared: 'for he shall save his people from their sins.'

The historical birth of J. is now generally fixed a few years—at least four years—before the commencement of the Christian era. The reasons of this opinion we cannot here state, but it may be observed that the reckoning of dates from the birth of J. is made more confidently stated. The Narratives respecting the J.'s death in 33 A.D. or whenever he was probably at least 37 years of age. As to the month or day of the birth of J., nothing is known, although the circumstance, that shepherds were watching their flocks by night, makes it very taut that it did
not take place at that time at which the festival of Christmas (q. v.) is held.

With the accounts given by the Evangelists of the birth of J., his ministry, death, resurrection, and ascension into heaven, every one may be supposed familiar.

The opponents of Christianity have not, in general, disputed the historic truth of the gospel narrative of the life of J.; the miracles of course excepted. Celsius and other heathen writers admitted even the truth of the miracles, but alleged them to have been wrought by magic, or to have been too few and inconsiderable to attest the claims of Jesus. Their modern successors have, of course, rejected these views. Some of them have endeavored to show that J. was ambitious of earthly power, but this has not been a prevalent theory. More generally, they have regarded him as merely adapting his conduct and teaching to the notions common among the Jews, and in particular to their expectation of the Messiah; whilst they admit the unequalled excellency of the religious and moral system taught by him. The inconsistency of this scheme is held to be obvious by orthodox theologians. They allege that if it were the purest system of morality as based on imposture. The character of J., as displayed both in his life and in his teaching, is one of the great arguments relied on by the advocates of Christianity. The correspondence of J. with Abgarus, king of Edessa, although we have it in Euseb. can only be ranked with monkish legends. No greater value are descriptions of the personal appearance of J., and pictures of him. See Christ, Pictures of.

JESUS, COLLEGE of, Oxford. In 1571, Queen Elizabeth, on the petition of Dr Hugh Ap-rice, or Price, granted a charter for the foundation of Jesus College, in which there were to be a principal, eight fellows, and eight scholars. In 1622, King James I. granted the college a new charter, including a code of statutes. These original foundations were set on a new footing in 1653 by the will of Sir Lesline Jeukyns, who added considerable endowments to the college, but arranged that the greater part of the fellowships, scholarships, and exhibitions, which were reserved by the founder for endowed colleges, were successively increased to 19 fellowships and 18 scholarships. The commissions under 17 and 18 Vict. c. 81, converted five of the fellowships into scholarships, and entirely suppressed one fellowship of the remaining fellowships, one month was confined to the Principality, and the other thrown open. Four may be lay fellows; the others must take orders within one year after they shall be of sufficient standing to be masters of arts. The scholarships are confined to Wales, with the exception of King Charles I.‘s scholarships (confined to Jersey and Guernsey), and two others, which are open. There are nearly thirty exhibitions in this college, of about £40 per annum. This college presents to about 200 living; in 1882, there were about 160 names on the books. This was the first Protestant college, and in its statutes the Protestant religion was asserted and guarded by many enactments.

JESUS COLLEGE, Cambridge, was founded by John Alcock, Bishop of Ely, in 1496, to whom the king granted for the purpose the muniments of St. Radegund, which was suppressed for the dissolve conduct of its inmates. The appointment of the master rests with the Bishop of Ely. There are six scholarships, three fellowships, and numerous scholarships. Amongst the distinguished members of this college are to be noted Richard Fox, Bishop of Winchester in the reign of Henry VII.;

Archbishop Cranmer; and Fisher, Bishop of Rochester in the reign of Henry VIII.

JESUS, SON OF SIRACH. See Ecclesiasticus.

JET, a bituminous mineral of a perfectly black colour, not harder than ordinary coal, but capable of being easily cut and carved, and of receiving a very beautiful polish. It takes its name from a river of Lycia, from the banks of which it was obtained. In time of Fliny, the name of the river and a small town on the banks of it were called Gagata, and the pieces of jet obtained from thence were called gagates, afterwards successively corrupted into gagenta and jet. It is now found in many parts of the world. In Great Britain, it is obtained chiefly at Whitby, in Yorkshire, where it is found mixed with fragments of bituminised wood of coniferous trees in the Upper Lias or Alum Shale of that district. Jet is only a peculiar form of pitch-coal, containing about 87 per cent of volatile matter, like the Albertite of New Brunswick and some of the cannel coals. It is electrical when rubbed, hence it has been called black amber by the Prussian amber-diggers, when it occurs in sand and gravel beds.

Very large quantities are obtained in France in the department of Aude, where it gives employment to numerous artisans, who form it into rosary beads, crosses, and other trinkets, which are extensively sold in Roman Catholic countries. Jet is also supplied in jet, which, like that of the French workings, is found in irregular veins in the lower marls of the cretaceous series, corresponding with the Sussex gault. The Spanish jet is found in Villaviciosa, in the province of the Asturias, and is principally manufactured at Oviedo. As a material for mourning ornaments, jet is admirably adapted, and for that purpose is used largely in this and other countries.

JETSAM means goods cast into the sea, which sink and remain under water. They belong to the Crown until the owner appear and claim them. See Flotsam. The subject is now chiefly important from its effects on the owners, and is treated under the head of Jettison (q. v.).

JETTISON is, in the law of the United Kingdom, the throwing overboard of a ship’s cargo, either in whole or in part, in cases of necessity, so as to lighten the vessel in a storm, or to prevent capture, or for other justifiable cause. It is obvious that great discretion is required, so as to judge when the proper time arrives for resorting to this desperate expedient; and in case of part only of the cargo being sacrificed, to select which part. Each case must depend on its own circumstances; and the master of the vessel is the authorised agent so as to bind all parties in such a situation. It often happens that the goods belong to different owners, and therefore, in order to compensate the owner of the particular goods thrown overboard, the doctrine of general average is resorted to. See AVERAGE. In case of a storm, the several persons interested in the ship, freight, and cargo in general contribute rateably to the loss; but there are exceptions when the goods were carried on deck. When the goods sacrificed by jettison have been insured, the insurer has the benefit of this contribution or average pro tanto.

JEW, THE WANDERING. The legend of the Wandering Jew, who cannot die, but, as the punishment of his sin, is obliged to wander over the face of the earth till Christ shall pronounce him at rest, is usually referred to the last day, several versions of it, and the story is taken from the narrative of the gospel of St John (xxi. 22) where Jesus says of John: "If I will that he tarry till I come, what is that to thee? follow thou me. Then went"
this saying abroad among the brethren, that that disciple should not die. It arose, probably, in the 13th c., when it is first related by Matthew Paris, and may be supposed to indicate the Jewish people, scattered throughout the world, and nowhere finding a home. According to the current legend, the Wandering Jew is Ahasinur, the shoemaker at Jerusalem, who, when the Saviour wished to rest before his house, on his way to Golgotha, droppèd a piece of gold to him, and the legendary name states it to be Pilate’s door-keeper, Kartaphilus, who struck Jesus on the back, as he led him out of his master’s judgment-hall. So recently as the last century, impostors took advantage of the belief in this legend, and gave themselves out for the Wandering Jew; and people were not wanting who, from time to time, maintained that he had appeared to them under different forms. A popular book relating in detail the history of the Wandering Jew has been published in the German, French, Dutch, and Latin languages. The legend has likewise been frequently worked up in a poetical form, as by A. W. von Schlegel in the romance entitled Die Wurme; by Schlegel’s pupil of Akbar; by Goethe’s Aus meinem Leben; by Mrs Norton in The Undying One (Lond. 1842); and by Eugène Sue in his Le Juif errant. Compare Grisse, Die Sage von Ewigen Juden.

JEWEL. (Ital. gioello, from gioia, joy,) a personal ornament, usually understood to mean a decoration in which one or more precious stones are set. Popularly, there is much confusion between the terms gem and jewel; the former belongs especially to precious stones, and the latter to ornaments formed of the precious metals with or without the aid of gems. The word is derived from the Italian gioia, joy, whence gioello, a jewel, such ornaments being indicative of pleasure.

JEWELLERY. The manufacture of jewels has in all times been a test of the artistic powers of a nation; for, being intended only for personal adornment, the production of the largest amount of beauty in the most limited space. It is probable that the wearing of ornaments of gold and silver is almost as early as the discovery of those metals. A mere heap of stones through the small pieces of gold or silver, to enable them to be strung round the waist or neck, would be the first stage; then, when the ductility of the metals became known, they would be beaten probably into bands or rings, giving rise to ring-mounts; these rings, when increased in size, would become torques for the waist, neck, arms, or ankles, labrets for the lips, and rings for the ears and fingers. As refinement increased, these articles would be made more and more ornamental; and the original object, of mere convenience and safety in carrying the much-valued metals, would be lost in the secondary one of personal adornment; the art of the goldsmith would be called into play, and the taste of the nation would be marked by the good or bad designs in demand for this purpose. Jewels being mere articles of luxury and taste, their possession always indicates to a certain extent the wealth of nations, and we are as much impressed with the advanced state of the ancient Egyptians by the fine art and refined taste exhibited in the jewellery found in their tombs, as by the vast architectural works of which they have left so many remains; indeed, modern art, with all its wondrous advances, cannot do more than equal the exquisite workmanship of those elegant golden jewels sent by the late viceroy of Egypt and M. Mariette to the International Exhibition, which were taken from the tombs of ladies of distinction, whose mummies they were found decorating. There is an essential difference between the jewellery of ancient and modern times. Our goldsmiths depend very much upon the processes of casting, drawing, stamping, and other metallurgical operations, and produce thereby great accuracy of outline and high finish. The ancients wrought by hammering, chasing, and repoussé work, the casting nature having the cast and skill of the artist, instead of the perfection of his tools and mechanical arrangements; consequently, their works bear the stamp of artistic productions, whilst modern works, however beautiful, have usually the character of mere manufactures executed with mechanical precision rather than artistic taste; and what they gain in nicety of finish is more than counterbalanced by what is lost in richness of effect. See DIAMOND.

JEWELS. Use of, in heraldry. By an egregiously absurd and unnecessary complication of nomenclature, introduced by way of adding dignity to the science of heraldry, the tinctures of the arms of peers have sometimes been designated by the names of precious stones: argent is pearl or crystal; or, topaz, jasper, purple, azure, emerald; sable, diamond; vert, emerald; and purpure, amethyst.

JEWISH LITURGY. See SILVER.

JEWISH SECTS, a term generally applied (after Josephus) to certain divergent schools which grew up in the midst of Judaism, subsequently to the Syrian wars. So far, however, from forming as the word would seem to imply, separate communities with a distinct worship and a religious law of their own, antagonistic to that of their brethren, the disciples of the different 'sects' belonged to the same religious community, adhered to the same practical religious law, and consequently could not well look upon each other as, in a manner, heretics. The chief points at issue were certain abstract doctrines, in connection with the peculiar manner in which this Law, as far as it is contained in the Scriptures, was interpreted and practised both in the West. While the Pharisees (q. v.) claimed for certain time-hallowed observances and doctrines not found in the Bible a divine origin, drawing them back through tradition—oraly transmitted from generation to generation—to Moses and the Sinaitic, and while they, by peculiar rules of an exegeses of their own, proved these same doctrines to be often latent, as it were, in the very letters of the Bible —the Sadducees (q. v.) rejected the divine origin of the 'oral law,' as well as certain religious observances, not distinctly set forth in the Sacred Record. As advanced or exalted class of Pharisaics were the Essenes (q. v.), who formed a kind of brotherhood, far away (with only solitary exceptions) from the corruption of cities, chiefly intent upon the exercise of practical virtues, and ruled by a severe code of morals. The tenets of each of these three 'sects' will be found treated separately under the headings indicated.

At a later period, shortly before and after Christ, numerous divergent religious doctrines, for the most part the result of a confused mixture of Judaism and Hellenism, or rather Alexandrianism (see Gnostics), were especially prevalent in the Jewish communities, and without the pale of Judaism. Many and obscure are the names of these 'sects' recorded by the early fathers of the church, but very little is known respecting their history and dogmas. Mention is made of Hellenists (Hillelites), not to be confounded with the large body of the Hellenists (q. v.) and Meristae (antagonistic school of Shammai), Gobelia (Christianising Jews), Herodiana (adherents of the foreign government), Ouemnites (Hellenists)
of exaggerated tendencies?), *Maqdihah* (strict Sabbatarians?), *Hemerobolista* (Essene)Accept the version of

In the 8th Christian c. (761 according to Munk), the Sadducean doctrine of the validity of the "oral law"—a doctrine which had died out after a brief existence—was revived again by Anan ben David, who is supposed to have held a high spiritual office (Rash Getha? Gaon?) at Bagdad at the time of the Caliph Al-Ma'mon A.D. 900, and who, rejecting the Talmud and Midrash, in the work of man, only allowed such laws and ordinances to be binding upon the community which resulted immediately from a simple and natural Scriptural exegesis. He thus became the founder of the most important sect of the *Karaites*, who, within an astonishingly brief period, spread over Palestine, Egypt, Greece, Barlary, Spain, Syria, Tartary, Byzantium, Fez, Morocco, and even to the ranges of the Atlas. They are now, however, found only in small numbers in Poland, Galicia, Odesia, the Crimea, Constantinople, Jerusalem, and Alexandria. Abrogating the "rabbinical" traditions, they erected a new traditional system of their own, to be altered and further developed by each of them, and by spiritual heads. Prayer, fasting, pilgrimages to Hebron, are the points of religious practice to which they pay the greatest attention. Their general conduct is even by their antagonists allowed to be without distinction. Innumerable rabbis have produced an extensive special Hebrew literature of their own, chiefly consisting of works on theology, philosophy, mathematics, astronomy, &c. The greatest number of these is preserved in the Imperial Library at St. Petersburg. Some of their principal authors are Anan, Shalmon b. Jeruham, Joseph b. Noah, Judshua, Jehudah Hachassas, Aaron R. Joseph, Abn b. Elisah, Eliah Beshitri, Kaleb, etc.

Another rather curious sect, known as the *Shobs*, was that founded by Sabbathai Levi from Smyrna (1625-1657), who proclaimed himself the Messiah, and found numerous followers throughout Germany, Poland, Italy, and Holland. In Sultani Mohammed IV., however, put an end to his mission by imprisoning him, and making him adopt Mohammedanism. Many of his disciples followed his example, others turned Roman Catholics—sacrificing their former enthusiasm for the opinion of the infallible Messiah, consisting chiefly of the belief in the Messianic order of their master, a distinct leaning to the dogma of the Trinity, and the abandonment of the hopes of a final return to the ancient Israel under the guidance of "Sabbathai David." They were thoroughly mystical interpretation upon the Bible, rejected unconditionalism of the Talmud, and exalted their special Kabalistick gospel, the Zohar, above all things created. This sect did not die out until the end of the last century, Jakob Frank, their last supreme pontiff (whose more intimate friends and followers called themselves by his name, Frankists) dying in a debtor's prison on the Rhine (1791).

We have finally to mention the modern *Chasidim*—not to be confounded with the ancient Chasidim (q.v.)—or *Brothers* (Raal Shen Tob), a side branch of the former sect, taking its stand like this on the Kaballa, but remaining ostensibly within the limits of the legalistic system. They are chiefly remarkable by their wild mode of praying, their supreme contempt for any but mystical and religious science, by their belief in the immortality of their temporary chiefs or saints (Zaddik Beal Shen), who rule their community unconditionally, are supposed to be invested with divine powers, and who also cure all their bodily ailments. The grandeur and pomp with which these are surrounded, contrasts most strikingly with the simple mode of life of their flock. Constant repentance, joyfulness, disinterestedness, benevolence, peacefellowship, with intrepidity, cleanliness, and temperance, are some of the chief points of the practical doctrine of this sect. One of the great reproaches, however, brought against them is, that their "joyfulness" often leads them into transgression; that, in fact, they are rather given to libertinism. This sect is numerous in Poland, Galicia, Russia, and Palestine.

The modern "Reformers," aiming chiefly at a simplification of the ceremonial, and abrogation of what they consider to be abuses and late additions in the divine worship, cannot well be called a sect—although, for the most part, they have synagouges and prayer-books of their own—since they belong, to all other intents and purposes, to the great body of the Jewish community. As the chief promoters of this movement may be considered Chorin, Creizenach, Hohnheim, Hess, Stern, &c.

JEWS (corrupted from *Yehudiin*), the name given, since the Babylonish captivity, to the descendants of the patriarch Abraham, who, about 2000 B.C., emigrated from Mesir to the east side of the Euphrates, to Canaan or Palestine. They were originally called Hebrrens (q.v.), Monotheists, or a belief in one God, the practice of circumcision, and the expectation of ultimately the resurrection of the dead, by the three distinguishing peculiarities transmitted by Abraham to Isaac, and from Isaac to Jacob and his descendants. The picture of patriarchal life presented to us in the book of Genesis is marked by an exquisitely beautiful simplicity, and bears traces of a great antiquity. In consequence of a famine in Canaan, Jacob, on the invitation of his son Joseph, who had become chief minister of the king of Egypt, went down thither with all his family, which numbered seventy souls; and obtained from Pharaoh permission to settle in the land of Goshen. Here the Hebrews resided, according to Exod. xii. 40, 430 years; (Bunsen (Exodus) calculated it at 2100 B.C.); according to the genealogical table of the Levites, in Exod. vi. 16—25, however, their sojourn would not have lasted longer than 210 or 215 years; most of the commentators, therefore, take, with Josephus, the 430 years to be reckoned from the deliverance of Abraham to the Exodus (cf. Galat. iii. 17). During the lifetime of Joseph, and probably for some generations afterwards, they were well treated, and prospered; but a new dynasty, supposed by some—with little show of reason—have been that of the Hyksos (q.v.) arose, and they were reduced to relentless slavery. A deliverer at length appeared in the person of Moses (q.v.), a man of grave and heroic character, who, though brought up by the daughter of Pharaoh as her son, and trained in all the learning of the Egyptians, was nevertheless filled with an intense and indignant patriotism, that acquired an additional elevation from the ardour of his religious feelings. The circumstances that preceded and characterized the exodus (about 1600 B.C.)—such as the ten plagues and the crossing of the Red Sea—are a source of continual controversy between the Rationalistic and the Supernaturalschola of biblical criticism; but the fact of an exodus would be disputed only by the wildest skepticism. The entire history of the people is pervaded by the memory of this grand event, upon which, as it were, their whole national existence is based; it inspires their poetry, and conveys their religion; and the Passover, with all its ceremonial and mementoes, was instituted expressly to remind them of that wondrous night of sudden liberation; while the Feast of Tabernacles was to
Jews.

to the memory of the latest generations the wanderings through the desert; and Pentecost, the act of the legislation on Sinai. Whether, however, in 215, or even in 430 years, the seventy ‘souls’ could have increased to 600,000 adult men, or, including wives and children, to between 2,000,000 and 3,000,000 souls, is a point to be determined not by arithmeticians, but by theologians.

The wandering in the wilderness of the Sinaiic peninsula is said to have lasted forty years, though a record of the events of two years only has been preserved. These, however, are obviously the most important, as they contain an elaborate account of the giving of the law (Exod. xix. seq.), which is represented as a direct revelation made to Moses by Jehovah himself, who descended upon Mount Sinai in fire, amid the roar of thunders and the quaking of hills. The antiquity, however, of the priestly or ecclesiastical portions of the Pentateuch is keenly disputed by many modern scholars of the highest reputation, who endeavour to shew the probability of such passages having been composed and inserted subsequent to the great organisation of the priesthood by David; and in proof of this, point, among other evidences, to the Book of Judges (q. v.), which narrates the history of the Hebrews for 300 years, after the conquest of Canaan, and which yet contains scarcely a single trace of the existence of a religious institution among them. Yet it is allowed almost on all hands, that the foundations, at least, of the Jewish theocracy, and probably also a large part of the superstructure, were the direct work of Moses himself, who indeed appears to have been pre-eminently fitted for the task of a legislator:—not to mention the fact that the ritualism of the Egyptians has many striking points of contact with that of the ancient Egyptians, with which he was well acquainted. This view, of course, does not interfere with the theory of a later composition of the Pentateuch (q. v.), in its present shape and its successive redactions and enlargements. But whatever period be allowed for the sojourn in the desert, the rough nomadic life, the frequent fighting with the fierce Beduin tribes, through whose territories they passed—besides the lofty influences of a stern religion—had transformed the runaway slaves of Egypt, by the time they approached the eastern borders of Canaan, into a nation of high-spirited and irresistible warriors.

Before proceeding further, it behoves us to trace a general outline of the Mosaic legislation. The laws promulgated under the ‘Covenant’ were, as we said, not entirely new. Many were merely the solemn confirmation of ancient patriarchal tenets, such as the worship of One Supreme Being through sacrifices, prayer, vows; circumcision; the government by heads of tribes and families, &c. Others must have been adaptations of Egyptian institutions. Others, again, owed their existence to the altered circumstances of the community; and it is undeniable that some of the ordinances contained in the Pentateuch were never carried into practice. The fundamental features of the religious as well as political constitution—both closely interwoven with each other—are the following: God is Creator and Lord of the universe. The universe is His own, and to man the use of all created things has been intrusted by Him will. God is therefore the King of the people. By the priests He is visibly represented. No man has the right to dispose of his own liberty. The soil is only given to the people for the sustent: man has no further individual right of possession over the soil. Every seventh year it is to be let to itself. The sale of land is prohibited; and after seven times seven years, every lease and mortgage of it is null and void, and it is to return to the heirs of those to whom it was originally assigned at the first division of the land.

The office of the Priests (q. v.) was in the hands of the tribe of Levi (q. v.), more especially the descendants of Aaron (q. v.). The Levites assisted in the management of the sanctuary and the holy rites, copied and expounded the Books of the Law, kept the records and accounts, and engaged in the general instruction of the people. Together with the priests, they had administrative and judicial functions, and they gave their judgment always in the name of God. The High-Priest (q. v.) constituted the highest court, and he was the oracle (Urim and Thummim). Periodical Feasts (q. v.) were instituted, in order that the dependence from the Divine King should always be kept in view by the people. Every seventh day the body should rest from labour (Sabbath), as every seventh year the soil was to rest (Sabbatical year); and every fiftieth (7 x 7) year (Jubël) was the great year of Remission. Three annual feasts, partly of an agricultural, partly of an historical character, were the Passah (q. v.), the Feast of Weeks (q. v.), and the Feast of Tabernacles (q. v). No less was the first of the seventh month to be kept holy. The temple of God was instituted a day of atonement and forgiveness of sins.

The form of government was at first a theocratic one. The people was divided into 12 tribes, which formed small republics, but were all united under the invincible rule of Jehovah. General national assemblies decided upon war and peace, and the like. Special provisions are also found for the contingency of the election of a king. After the conquest of Palestine, every city had a judge, chosen by the heads of the families and the tribes. The punishments were either death, flagellation, or fines. Three Levitical cities were named by Moses as asylum or places of refuge for man-slayers whose guilt was not yet fully established. Every free citizen was bound, from his 20th year, to military service in case of war. To the besieged city, terms of capitulation were first to be offered; were these rejected, the city was to be taken, and the males to be put to the sword. In all other cases, the virtues of charity, justice, and kindness, even towards animals, are repeatedly impressed upon the people. How far these fundamental rules were either further developed or neglected, we cannot shew in this place.

The ‘land of promise’ became theirs at last (about 1430 B.C.), under Joshua (q. v.), the successor of Moses. Tribe after tribe was swept from its ancient territory, and for the most part either annihilated or forced to flee. Yet the whole bulk of the native inhabitants was not exterminated or wholly expelled, nor even subdued till a much later period: a circumstance fraught indeed with the most disastrous consequences to the new commonwealth. The country was now divided among the tribes. The magnificent pastoral region to the east of the Jordan had before been chosen by the tribes of Reuben, Gad, and the half-tribe of Manasseh as an earlier period, because they had a very great multitude of cattle (Numb. xxxii. 1); but they now for the first time entered on possession of it. The land west of the Jordan was parcelled out to the remaining—Judah, Simeon, Levi, Benjamin, Ephraim, the second half-tribe of Manasseh, Issachar, Zebulon, Napthah, and Asher. The tribe of Levi received, instead of a province, 48 cities scattered throughout Canaan and the tenth part of the fruits of the earth; and they were generally to settle individually throughout the land where they chose (Leviticus, Priests, High-Priest).

After the death of Joshua (about 1330 B.C.), the
want of a chief to the young state became sadly palpable. Little regard was paid to the 'Mosaic' institutions; the single tribes pursued their own individual interests; intermarriages with the idolatrous natives weakened the bond of union still further; and the next consequence was, that the tribes were singly subdued by the surviving nations. At this juncture there arose at intervals valiant men and women—Shofetim—Judges, who liberated the people from their oppressors, the Midian and gray-haired Gibeon, and the two Amorites. Fifteen of those are named, some of whom appear to have been contemporary with each other, and to have exercised authority in different parts of the country. This period constitutes the 'heroic' age of Hebrew history. Among these Judges, the prophetess Deborah (q. v.), Gideon (q. v.), Jephthah (q. v.), the herculean Samson (q. v.), and the prophet Samuel (q. v.) are especially notable; the last mentioned was, in every sense of the word, the greatest Hebrew that had as yet appeared since the days of Moses. With him begins a new and higher stage in the development of the national character, chiefly through the instrumentality of the priestly order, whose spiritual, for the most part well-directed and humane, influence, was never so effectively exercised as under him and most distinctly brought to bear upon the commonwealth. Samuel, the first of the prophets, was also the last of the republican chiefs of the confederate tribes. Wearied of their intestine feuds, harassed by the incursions of their predatory neighbours, chiefly, however, goaded by the characteristic desire 'to be like all the other nations' (1 Sam. vii. 5), the people compelled him, when he had become 'old and gray-haired' (1 Sam. vii. 19), to witness the behaviour of his sons, whom he had made judges, unmitred them to be his successors—to choose for them a king (1050 B.C.).

The first who exercised regal authority was Saul (q. v.), the Benjamite chief. But though a distinguished warrior, and a man of royal presence, he appears not to have possessed the mind of a statesman; and his wildness, and the paroxysms of insanity, brought on chiefly, as it would seem, by the openly-expressed dissatisfaction of Samuel, finally alienated from him many of the bravest and best of his subjects. After his death on Mount Gilboa, David (q. v.), his son-in-law, was proclaimed king. This monarch ruled for the longest period that ever sat on the throne of Israel. He ruled, as is commonly computed, 1058—1018 B.C. His reign, and that of his equally famous son, Solomon (q. v.), are regarded as the golden time of Hebrew history. The remaining aborigines of Canaan and its borders—viz., the Philistines, Edomites, Amalekites, Moabites, &c.—were thoroughly subdued; the boundaries of the Hebrew kingdom were extended as far as the Euphrates and the Red Sea; Jerusalem was captured by escalade, and made the capital of the conqueror; the priesthood was reorganised on a splendid scale; the arts of poetry, music, and architecture were cultivated; schools of prophecy (first established, probably, by Samuel) began to flourish; a magnificent temple was to be built in the capital; and commercial intercourse was carried on with Phoenicia, Arabia, Egypt, with India and Ceylon, and perhaps with even Sumatra, Java, and the Spice Islands. But the temple was a banker at the root of all this prosperity. The enormous and wasteful expenditure of Solomon forced him to lay heavy taxes on the people. His wealth did not enrich them; it rather made them poorer; and although gifted with transcendent wisdom and the most brilliant mental powers, towards the end of his life he presents the sad spectacle of a common eastern despot, voluptuous, idolatrous, occasionally even cruel, and his reign (1018—79 B.C.) cannot but be regarded, both politically and financially, as a splendid failure. After his death (798), the Hebrew monarchy, in which the germs of dissension—chiefly jealousy against the influence of Judah—had been already growing up, was many a year split under Rehoboam into two sections (975 B.C.): the kingdom of Judah, under Rehoboam, son of Solomon; and the kingdom of Israel, under Jeroboam, the Ephraimite. The former of these countries retained the two tribes of Judah and Benjamin, together, probably, with some Danite and Simeonite cities; the latter, the remaining ten. After 19 kings, of different dynasties, among whom Jeroboam, Ahab, Joram, Jeroboam II, Pekah, and Whor, whom succeeded to the throne otherwise than by the murder of their predecessors, the country was finally conquered by Salamanasar, king of Assyria; its sovereign, Hoshea, thrown into prison; the mass of the people carried away captive (720 B.C.) into the far east, the mountainous regions of Media, and their place supplied by Assyrian colonists, brought from Babylon, Persia, Shushan, Elam, and other places under Assar-Appa. These, mingling and intermarrying with the remnant of the nation, and forming the mixed people called Samaritans (q. v.), among the twenty kings of the House of David, who ruled over Judah, Jehoshaphat, Uziah, Hezaj, Uzziah, and Jotham, distinguished themselves by their abilities as rulers, and by their zeal for the worship of Jehovah. Yet even they were, for the most part, unable to stay the idolatrous practices of the people, against which the prophets' voices even in their latter days could not prevail. Other kings were, for the most part, more or less unfaithful themselves to the religion of their fathers, and unable to withstand the power of the Egyptians, Assyrians, and Babylonians, to each of whom they in turn became tributary, until at last Nebuchadnezzar stormed Jerusalem (586 B.C.), plundered and burned the temple, put out the eyes of King Zedekiah, and carried off the most illustrious and wealthy of the inhabitants prisoners to Babylon. The Hebrews, who had been exiled 134 years before the inhabitants of Judah, never returned. What became of them has always been, and, we presume, will always remain, matter of vaguest speculation. See BABYLONIAN CAPTIVITY.

All that we know of the condition of the Hebrews during the captivity, relates exclusively to the inhabitants of the kingdom of Judah. And so mild, especially during the later years, was the treatment which they received in the Babylonian empire, that when liberty was announced to the whole body of the captives, only the lowest of the low returned, together with the Levites and Priests (cf. Talm. Kidd. iv. 1). The Book of Esther likewise bears testimony to the vast numbers that had remained scattered over the vast empire. See BABYLONIAN CAPTIVITY.

The influence of this exile, however, was of a most striking and lasting nature. Babylon henceforth became the most important and central institution of the synagogue in its wider sense. Common religious meetings were provided, prayer, were established; many of the Mosaic laws were re-enforced in their primitive rigour; and the body of the "oral law" began to shape itself, however rudely, then and there. Besides, there began to grow up and unfold itself the belief in a Messiah, a Deliverer, one who should redeem the people from their bondage. The writer of the last
27 chapters of Isaiah, who is usually called by modern scholars the 'Younger Isaiah,' is held to belong to this period, and expresses in glowing language the hopes of the exiles; no less do many of the Psalms belong to this time. From this period, likewise, the immortality of the soul, and the belief in another life, appear more distinctly in the popular creed, in which, if they had existed at all, they had been obscured by the more immediate hopes and the generally straining of temporal rewards and punishments revealed in the law. But in the writings of the Babylonian prophets, in the vision of dry bones in Ezekiel, and in the last chapter of Daniel, these doctrines assume a more important place; and from the later books, which are all called the Apocrypha, these opinions appear to have entered fully into the general belief. In other respects, particularly in their notions of angels, who now appear under particular names, and forming a sort of hierarchy, Jewish opinions acquired a new and peculiar colouring from their intercourse with the Babylonians' (Dean Milman's History of the Jews, Lond. 1829, vol. ii. pp. 13, 14). Compare articles Demons and Devil.

Jews. The Jews are generally computed to have lasted seventy years. This is not strictly correct; it lasted seventy years, if reckoned from the appearance of Nebuchadnezzar in Anterior Asia (606), but only fifty-two counting from the destruction of Jerusalem to the Caliphate of Cyrus. When Cyrus had overthrown the Babylonian kingdom (538 B.C.), the condition of the Hebrews improved considerably. The new monarch must have felt that he could rely on them, as being strangers in the land, and necessarily more or less hostile to his conquerors, the Babylonians. Daniel rose higher and higher in dignity and power, and finally became 'supreme head of the pashas to whom the provinces of the vast empire were committed.' Through his influence, Cyrus was prevailed upon to issue an edict permitting the exiles to return home. A minute account of the circumstances attending this joyous event is given in the Books of Ezra and Nehemiah. Upwards of 40,000 persons, including a new and peculiar colouring from their intercourse with the Babylonians' (Dean Milman's History of the Jews, Lond. 1829, vol. ii. pp. 13, 14). Compare articles Demons and Devil.

Daniel rose higher and higher in dignity and power, and finally became 'supreme head of the pashas to whom the provinces of the vast empire were committed.' Through his influence, Cyrus was prevailed upon to issue an edict permitting the exiles to return home. A minute account of the circumstances attending this joyous event is given in the Books of Ezra and Nehemiah. Upwards of 40,000 persons, including the whole four of the twenty-four courses of priests, set out under the leadership of Zerubbabel, a descendant of their old kings.

Notwithstanding the many and harassing obstacles raised to the Warnians, the mixed people of Assyrians and Israelites, against whom the scurrilous exiles entertained strong religious and national objections, the rebuilding of the 'Temple of the Lord' was at last commenced in the first year of Darius, and in the sixth year of his reign it was finally completed. [Hagia; Zachariah.] The waste cities were likewise rebuilt and repopulated. During the long reign of Darius, the Jews were blessed with a high degree of material prosperity. Under his successor, Xerxes, probably occurred the incidents recorded in the Book of Esther. In the seventh year of Artaxerxes, the successor of Xerxes, Ezra the priest, invested with high powers, and accompanied with a great retinue of his professional brethren, headed a second migration. Thirteen years later, during the reign of the same monarch, Nehemiah, his cup-bearer, but a man of Jewish family, was ordered to proceed to Jerusalem, and, aided by others, succeeded in secretly fortifying the city, notwithstanding the continued opposition from Samaritans, Ammonites, and Arameans.

The strictest observance of the 'written law,' even of those of its parts which had for some reason or other disregarded, was now rigorously enforced, and many 'oral ordinances' were put into practice, which do not seem to have been much heard of previously. The supreme spiritual authority was vested in a society of pious and pre-eminently learned men, founded by Ezra, out of which grew the 'Great Synagogue,' of whose existence modern scholars no longer see any reason to doubt. The compilation and transcription of the sacred records began, periodical public readings and expounding of the law were instituted, and the vast Targumic, as well as the so-called rabbinical literature, generally dates—in its earliest beginnings—from this period under the auspices of Ezra, and the link between the J. and Samaritans became final, by the erection on Mount Gerizim (near Samaria) of a rival temple to that at Jerusalem, and the creation of a rival priesthood.

For more than a hundred years, Ezra, J., (361-331) under the Ptolemaic, to the Jewish observers, was too insignificant to excite any attention from the Greeks, then in the full meridian of their political and literary greatness; and scanty are the accounts which, as yet, have out of the mazes of ancient Jewish literature been brought to light, with respect to the inner intellectual life of the J. during that period. That, although silent, it must have been extremely active and rich, is amply evidenced by the sudden appearance, immediately afterwards, of a vast amount of literary production.

Alexander the Great, on his way to conquer the whole East, did not deem it necessary to storm Jerusalem. The inhabitants submitted, and he even decreed to have sacrifices offered on his behalf to the national god of the Persian king, but the number of whom, and of Samaritans, he carried away to Egypt (where J. were supposed to have immigrated as early as the time of the last kings of Judah, and later under Artaxerxes), as a third of his newly-founded city Alexandria with his Jewish captives. After him, Ptolemy the son of Lagus, surnamed Soter, one of Alexander's generals, who had become king of Egypt, invaded Syria, took Jerusalem (301 B.C.), and a third of his inhabitants, whom he forced to settle chiefly in Alexandria and Cyrene. The Egyptian (Alexandrian) 'Dispersion' (Golah)—destined to be of vastest importance in the development of Judaism and Christianity—gradually spread over the whole country, from the Libyan desert in the north, to the boundaries of Ethiopia in the south, over the Cyrenaica and part of Libya, and along the borders of the African coasts to the Mediterranean. They enjoyed the friendship of their fellow-countrymen, both Egyptian and Greek, and were admitted to the highest dignities and offices; so that many further immigrants followed of their own free-will. The free development which was allowed them, enabled them to reach, under Greek auspices, the highest eminence in science and art. In Greek strategy and Greek statesmanship, Greek learning and Greek refinement, they were ready and brilliant disciples; even their artisans and workmen were sent for by distant countries. From the number of Judaio-Greek fragments, historical, didactic, epic, &c. (by Demetrius, Malcho, Eupolemos, Artapan, Aristocles, Jason, Ezechielos, Philo, Theodot, &c.), which have been survived, we may easily conclude what an immense literature must have sprung up here within a few centuries in the midst of the Judaio-Egyptian community. To this is owing, likewise, the Greek translation of the Bible, known as the Septuagint (q.v.), which enabled the people more and more from the language of their fathers, the Hebrew, gave rise to a vast pseudo-epigraphical and apocryphal literature (Orphica, Syllabinae, Pseudohoric; poems by Linus, Homer, Hesiod; additions to Esther, Ezra, the Maccabees, Book of Wisdom, Baruch, Jeremiah, Susanna, &c.), not to mention the peculiar Graeco-Jewish philosophy, which sprang from a mixture of Hellenism and...
JEWS.

Orientalism, of which we have spoken at some length in the art. Goyetish, and
foremost, the land of Judæa herself remained under Egyptian rule. During the reigns of the
first three Ptolemies, Soter, Philadelphus, and Euergetes, it prospered, but after the accession of Ptolemy Philopator, a change for the worse came over it. Not that the fighting both in and out of Egypt was altogether easier, for yet, harder still under his son, Antiochus Epiphanes, or Epimanes (the Madman). With every means a cruel and foolishly policy could devise, this king outraged the religious feeling of the nation, and endeavoured to tear out every root of the sacred creed. At different periods he sent his generals to Jerusalem to pillage and burn, and to force the Jews into the Greek religion. The temple at Jeru-
salem was finally dedicated to Jupiter Olympius; idol altars were built in every village, and the people forced to offer swine daily. Some yielded, many fled, the greater part preferred martyrdom in some shape or other.

At this juncture the heroic family of Mathatia, a priest of the house of the Asmonean, rose, together with a few patriots, against the immense power of the Syrians. The national cause quickly gathered strength, and after the death of Mathatia (161 B.C.), his brothers Jonathan and Simon completed the work of deliverance, and re-instituted the Sanhedrin (145 B.C.). During their rule, alliances were twice formed with the Romans, and the country once more began to prosper. Under Simon more especially, Syrian rule became a mere shadow: his was an almost absolute power. So much so, that in the person of his brother, John Hyrcanus, a new Jewish era was commenced, and public documents bore date, 'In the first year of Simon, high-priest and chief of the Jews.' Simon's son, John Hyrcanus, after a brief period of vassalage to the Syrians, extended his authority over Samaria, Galilee, and Idumea—his grand triumph, in the eyes of his countrymen, being the destruction of the Samaritan temple on Mount Gerizim (129 B.C.); but in reality his most surprising success was the subjection to the Idumæans, and their conversion to the Jewish religion. His son, Aristobulus, added Iudaea—a district at the base of the Anti-Libanus—to his dominions, but died, after a short reign, of the gout, which, as his most illustrious successor, the same Alexander, to whom the secular dominion had been bequeathed by Hyrcanus, but whom Aristobulus had cast into prison, and caused there to die of hunger. The son who succeeded him was Alexander Jannæus. Constantly fighting, and generally besting, this king yet, strange to say, contrived to enlarge his territories; restless and enterprising as he was cruel and sanguinary, he gave his opponents no rest, and his opponents were all his neighbours in turn, excepting Ueopatra, queen of Egypt. Attached to the Saducees (q. v.), like his father, and probably something of a pagan, he was disliked by the mass of his countrymen, and a civil war of six years' duration ensued. After a brief period of peace, he died (76 B.C.), recommending, however, his wife, Alexandra, to throw herself into the arms of the very party who had thwarted him all his life, the 'Hasidæes (q. v.), as the best way of retaining her ascendancy. This advice was followed, and the kingdom was prudently for nine years. The Pharisaic party, however, asserts the power which fell into their hands, and a reaction took place. Aristobulus, youngest son of the queen, and a prince of great spirit, placed himself at the head of the movement, marched to Jerusalem, took possession of the city, and ejected his elder brother, Hyrcanus II, from the sovereignty.

Afterwards, however, the latter, at the instigation of Antipater, the Idumean, and father of Herod the Great, fled to Antioch, king of Northern Arabia, who was induced, by the promise of a cession of the territory which had been acquired by Alexander Jannæus, to take up arms on his behalf. This led to the interference of the Romans, who were then in Syria and Idumea, and the secession of the vicissitudes, Jerusalem was captured (63 B.C.) by Pompey, who had decided in favour of Hyrcanus, and Judæa made dependent on the Roman province of Syria, and Hyrcanus appointed governor and high-priest. Aristobolus, however, with his two sons, Alexander and Antigonus, and two daughters, were carried captive to Rome. In 54 B.C., Licinius Crassus plundered the temple, which Pompey had previously seized; his ill-gotten gains are said to have amounted to £2,000,000. He fell shortly afterwards in the war against the Parthians, and his companion, Cassius Longius, succeeded in completely routing Aristobolus' army.

Meanwhile, the war between Cæsar and Pompey broke out. In Syria, the partisans of the latter were numerous, and contrived to poison Aristobulus, and execute his son Alexander, who were Cæsareans (49 B.C.). After the death of Pompey, however, things were changed; and finally, Idumea (who was both his minister and master), saw the necessity of securing the favour of Cæsar. With Hyrcanus II ended the line of Asmonean princes; they exercised nominally supreme authority both in the civil and religious affairs of Palestine, i.e., they were both sovereigns and high-priests; but, as we have already indicated, the real religious authority had passed into the hands of the priest-
hood, and especially of the Sanhedrin. Meanwhile, Augustus, by the intervention of the Romans, obtained for himself the office of procurator of Judæa, which he held for some time, and was appointed governor of Jerusalem, and his younger son Herod governor of Galilee. The Jewish or national party took the alarm at this sudden increase of Idumean power; strife ensued; and ultimately Antipater perished by poison; but Herod, by the assistance of the Romans, finally entered Jerusalem in triumph (37 B.C.), caused Antigonus, the last male representative of the Asmonean line, to be publicly degraded, and his most conspicuous enemies put to death, and commenced the difficult task of governing a people who were growing more and more unruly every day. The political events which occurred during the government of the Herods, are briefly touched upon under the heads Herod (q. v.), AGRIPPA (q. v.), and ANTIPATER (q. v.).

After Herod's death (3 B.C.), Archelaus, one of his sons, ruled Judæa and Samaria: but his arbitrariness, and still more his constant attacks upon religion, made him hateful to the people; and Augustus, listening to their just complaints, deprived him of his power, and banished him to Vienne (6 A.D.). Judæa was now thrown together with Syria, and was ruled by Roman governors.

In the year 38 A.D., the Emperor Caligula issued an edict ordering divine honours to be paid to himself. Everywhere throughout the Roman dominions the J. refused to obey. At Alexandria, a frightful massacre took place, and for ten days and nights, as if the whole of the inhabitants of Judæa, too, were doomed to perish; but Herod Agrippa I. (q. v.), tetrarch of Northern Palestine, and a friend of Caligula's, dissuaded the emperor from carrying out his barbarous design. About the same time the Babylonian J. became involved in a quarrel with the Parthians, and were slaughtered in vast
The accession of Claudius, on the assassination of Galba, brought a momentous change in the Roman world. The first days of Claudius were marked by a reign of terror, as the emperor himself and his family were targets of assassination attempts. The Herod Agrippa I, a loyal and able ruler, was granted some degree of autonomy and power over his territories in the east, including parts of modern-day Jordan, Syria, and Palestine. His rule was characterized by stability and prosperity, as he worked to restore order and maintain peace in the region. However, his reign was short-lived, and he was eventually murdered by his own people, leading to a period of uncertainty and violence.

Despite the tumultuous events of the time, the Jews continued to cling to their faith and traditions. The Sanhedrin, or Jewish high council, was still in place, and the Temple in Jerusalem remained a place of pilgrimage and devotion. The Roman authorities, under governors such as Pontius Pilate, attempted to maintain order and control, but their efforts were often met with resistance from the Jewish population.

In the meantime, the diaspora of Jewish communities throughout the Mediterranean world continued to grow, with large concentrations of Jews living in cities such as Alexandria, Antioch, and Rome. These communities maintained their religious and cultural practices, even as they adapted to the local customs and laws of their host societies.

The period was also marked by significant events in the lives of individual Jewish leaders. The rabbi and scholar Akiba ben Joseph was a central figure in this time, as was the young pacifist and political activist Gamaliel II. The struggle for religious freedom and political independence continued, with some Jews advocating for peace and cooperation with the Romans, while others took up arms in rebellion.

Against this backdrop, the story of the Jewish people continued to unfold, as they faced new challenges and opportunities. The end of the Roman Republic and the rise of the Roman Empire brought new threats and opportunities, as the Jews sought to navigate their place in the ever-changing political landscape.
of wealth and knowledge. The brief rule of Julian the Apostate even shed a momentary gleam of brilliancy over the wretched state of the church, and some of the bishops who manifested on obtaining his permission to rebuild the temple at Jerusalem, is one of the most sublime spectacles in their history. The death of this emperor, however, frustrated their hopes; and the rapid increase of ecclesiastical power was, of course, hurtful to them in a variety of ways, although the emperors now began, in the decline of their authority, to protect them as far as they could. In 418 A.D., they were excluded from the military service; and in 429 A.D., the patriarchate at Tiberias was abolished. After the fall of the Western Roman empire, their fortunes were different in different countries. In Italy, Sicily, and Sardinia, they were for a time almost unmolested; in the Byzantine empire, they suffered many oppressions; while in the 6th and 7th centuries, the Franks and Spanish Visigoths inflicted on them frightful persecutions.

At a more volcanic outburst of Mohammedanism in the Arabian peninsula, was at first disastrous to the J. in that part of the world. For several centuries, a Jewish kingdom had existed in the south-west of Arabia. It was called Himyarites or a. the result of the decay of the eastern empire, and the flight of the emperors to the Moslem rulers; about 120 years before Christ. About 290 A.D., the Jewish religion even mounted the throne of Yemen. Twice, however (by the Ethiopian kings, Abkid and Ez-Basha), were the Jewish kings driven from it, and the Christian religion was introduced into that part in 530 A.D. At first, Jewish tribes around Mecca and Medina entertained opinions favourable to Mohammed as an Arabian chief, but when Islam began to threaten their own faith, and even the Christian church and state, and the Moslems, who called Christian religion as a very easy means of getting rid of their obligations. Thus, Philippe Auguste, under whose rule the J. seems to have held mortgages of enormous value on the estates of the church and state, for 20 years, only the churches due to them, forced them to surrender the plagues in their possession, seized their goods, and banished them from France; but the decree appears to have taken effect chiefly in the north; yet in southern France, they endured; and less than 20 years after, the same monarch was glad to let them come back and take up their abode in Paris. Louis IX., who was a very pious prince, among other religious acts, cancelled a third of the claims which the J. had against his subjects, for the benefit of his soul. An edict was also issued for the seizure and destruction of their sacred books; and we are told that, at Paris, twenty-four carts filled with copies of the Talmud, &c., were consigned to the flames. After the crusade to the fair, they were again expelled from France (1306 A.D.) with the usual accompaniments of cruelty; but the state of the royal finances rendered it necessary, in little more than a dozen years, to recall them. The king was allowed to renounce payment of the debts due to them, on condition that two-thirds of the whole should be given up to the king! But a religious epidemic, known as the Rising of the Shepherds, having seized the common people in Languesdoci and the central regions of France (1321 A.D.), they signalised themselves by horrible massacres of the detested race; so horrible, indeed, that in one place, Verdun, on the Garonne, the J., in the madness of their agony, threw down their children to the Christian mob, from the tower in which they were gathered, hoping, but in vain, to appease the demoniacal fury of their assailants. In the following year, the plague broke out, and the 'bulls,' which had been laid to their charge by the shudders to read of what followed; in whole provinces, every Jew was burned. At Châlon, a deep ditch was dug, an enormous pile raised, and 100 of both sexes burned together! Yet Christianity never produced more resolute martyrs; as they, laying themselves into the place of torment, sang hymns as though they were going to a wedding. Finally, in 1395, they were indefinitely banished from the middle of France.

Their first appearance in England dates from the period of the Saxons. They are mentioned in the

In Italy, their position was made tolerable by considerable pecuniary sacrifices. Here and there, at intervals, and even of Christian intolerance might break out, but they enjoyed for the most part the protection of the popes.

More favourable was their lot during the 8th and 9th centuries in France, especially in Paris, where the reigns of Louis le Debonnaire, they were actually all-powerful. After 877 A.D., however, when the weak Carolingians had begun to rule, and the church was advancing with impetuous strides, a melancholy change came to them; kings, bishops, feudal barons, and even the municipalities, all joined in a carnival of persecution. From the 11th to the 14th c., their history is a successive series of massacres. All manner of wild stories were circulated against them: it was said that they were wont to steal the host, and to contumaciously stick it through and through; to inveigle Christian children into their houses, and murder them; to poison wells, &c. They were also hated for their excessive aury, though there can be no doubt that more blame is attachable to those whose tyranny, by depriving them of the right to possess land, had compressed their activity into the narrower channels of traffic. Occasionally, however, those of the first rank, outstanding in the army, or in the state, were excused, and they called Christian religion as a very easy means of getting rid of their obligations. Thus, Philippe Auguste, under whose rule the Jews seem to have held mortgages of enormous value on the estates of the church and state, for 20 years, only the churches due to them, forced them to surrender the plagues in their possession, seized their goods, and banished them from France; but the decree appears to have taken effect chiefly in the north; yet in southern France, they endured; and less than 20 years after, the same monarch was glad to let them come back and take up their abode in Paris. Louis IX., who was a very pious prince, among other religious acts, cancelled a third of the claims which the J. had against his subjects, for the benefit of his soul. An edict was also issued for the seizure and destruction of their sacred books; and we are told that, at Paris, twenty-four carts filled with copies of the Talmud, &c., were consigned to the flames. After the crusade to the fair, they were again expelled from France (1306 A.D.) with the usual accompaniments of cruelty; but the state of the royal finances rendered it necessary, in little more than a dozen years, to recall them. The king was allowed to renounce payment of the debts due to them, on condition that two-thirds of the whole should be given up to the king! But a religious epidemic, known as the Rising of the Shepherds, having seized the common people in Languesdoci and the central regions of France (1321 A.D.), they signalised themselves by horrible massacres of the detested race; so horrible, indeed, that in one place, Verdun, on the Garonne, the J., in the madness of their agony, threw down their children to the Christian mob, from the tower in which they were gathered, hoping, but in vain, to appease the demoniacal fury of their assailants. In the following year, the plague broke out, and the 'bulls,' which had been laid to their charge by the shudders to read of what followed; in whole provinces, every Jew was burned. At Châlon, a deep ditch was dug, an enormous pile raised, and 100 of both sexes burned together! Yet Christianity never produced more resolute martyrs; as they, laying themselves into the place of torment, sang hymns as though they were going to a wedding. Finally, in 1395, they were indefinitely banished from the middle of France.

Their first appearance in England dates from the period of the Saxons. They are mentioned in the
eclesiastical constitutions of Egbert, Archbishop of York, 740 A.D.; they are also named in a charter to the monks of Canterbury, 833 A.D. William the Conqueror and his son, William Rufus, favoured them; the latter, on the occasion of a public debate between them and the Christians, even swore with humorous profanity, that if the rabbits beat the birds in the fields of St Luke, he would turn a Jew himself. The same reckless monarch carried his contempt for the religious institutions of his kingdom so far, that he actually farmed out the vacant bishoprics to the J., and at Oxford, even their seat of learning, they possessed three hall—Lombard Hall, Moses Hall, and Jacob Hall, where Hebrew was taught to Christians as well as to the youths of their own persuasion. As they grew in wealth, they grew in unpopularity. On the day of the coronation of Richard the Lion Heart (1189 A.D.), some foreign J. being perceived to witness the spectacle, from which their nation had been strictly excluded, a popular commotion against them broke out in London; their houses were pillaged and burned; and though Sir Richard Glanville, the chief-justice of the realm, acting under the orders of the indignant king, partially succeeded in arresting the havoc, and even in bringing some of the mob to justice (they were hanged), yet the barbarous bigotry of priests and people prevented anything like just or salutary punishment. Similar scenes were witnessed at Norwich, Edmundbury, Stamford, and York; in the last of these towns, most of the prelates and voluntary laymen (Kiddush Hashem) in the synagogue were forced to baptize. When Richard returned from Palestine, their prospects brightened a little; though still treated with great rigour, yet, as the Jews were protected, for a consideration, by John Lackland at first covered them with honour, but the popular and priestly hatred only became the stronger; and on a sudden, the vacillating and unprincipled king turned round on his protégés, after they had accumulated great wealth, and imprisoned, maltreated, and plundered them in all parts of the country. Under Henry III., they were mulcted enormously. Accused of clipping the coin of the realm, they were ordered to pay in the royal exchequer (1220 A.D.) a third of their movable property. To this reign belongs the now exploded story of the crucifixion of the Christian boy during the sentence of death. The account of Edward I. did not mitigate their misery; some efforts, indeed, were made to induce them to give up their profession of usury, as was also done in France and elsewhere during the same period, but the fact is, that they were so heavily taxed by the sovereigns or governments of Christendom, and at the same time debauched from almost every other trade or occupation—partly by special decrees, partly by the vulgar prejudices—that they could not afford to prosecute ordinary avocations. The attempt made by the Dominican friars to convert them, of course, failed utterly; and in 1253, the J.—no longer able to withstand the constant hardships to which they were subjected in person and property,—begged of their own accord to be allowed to leave the country. Richard of Cornwall, however, persuaded them to stay. Ultimately, in 1290 A.D., they were driven from the shores of England, pursued by the executions of the infuriated rabble, and lying in the hands of the king all their property, debts, obligations, and mortgages. They emigrated for the most part to France and Germany. Their number is estimated at about 16,000. They were looked upon as the special property of the sovereign, who bought and sold them, and were designated his Kammerknechte ('chamber-servants'). As already said, they made their appearance in that region almost as early as the time of Constantine. About the 8th c. they are found in all the Rhenish towns; in the 16th c., in Saxony and Bohemia; in the 11th, in Swabia, Franconia, and Vienna; and in the 12th, in Brandenburg and Silesia. The same sort of treatment befell them; not only did they have to pay all manner of iniquitous taxes—body-tax, capita tion-tax, trade-taxes, coronation-tax, and to present a multitude of gifts, to mollify the avance or supply the necessities of emperors, princes, and barons. A raid against the J. was a favourite pastime of a bankrupt noble in those days. The Crusades kindled a spirit not in Germany only, but through all Christendom, hostile to the 'enemies of Christ.' Treves, Meta, Cologne, Mainz, Worms, Spire, burg, and other cities, were deluged with the blood of the 'unbelievers.' At such epochs, the passions of the populace and of the lower clergy could not be restrained. The word Hej (said to be the imitans of Herodagnima est perdata, Jerusalem is taken) was carried through all the cities of the empire became the signal for massacre, and if an insensate mob sounded it along the streets, it threw the rabble into paroxysms of murderous rage. The J. were expelled from Hamburg (1311 A.D.), Norway (1314 A.D.), from Vienna (1316 A.D.), Mecklenburg (1225 A.D.), Breslau (1226 A.D.), Brandenburg (1243 A.D.), Frankfurt (1241 A.D.), Munich (1265 A.D.), Nurnberg (1290 A.D.), Prague (1291 A.D.), and Ratisbon (1475 A.D.). The Holy Roman Empire was the first occasioned great and widespread persecution (1348—1350 A.D.). They were murdered and burned by thousands, and many even sought death amidst the confonnations of their persecution. The J. also almost disappeared from Germany; only, however, to return, for their services were indispensable. Only here and there, however, they possessed the rights of citizens, or were allowed to hold unmovable property; in general, they were permitted, in some way or other, to engage in commerce and usury, and the law turned on them its harshest aspect. Repeatedly, too, the emperors gratified at once their piety and their greed by cancelling their pecuniary claims. In many places, they were compelled to wear a dress denoting their inhumanity, and were excluded from the town, known as the Judenstrasse (Jews Streets). Switzerland, whither they came at a comparatively late period, commenced to persecute them about the same time. The J. were expelled from Lucerne (1540 A.D.), Zurich (1542 A.D.), Basle (1545 A.D.), Schaffhausen (1548 A.D.), Winterthur (1548 A.D.), and Schaffhausen (1550 A.D.). In the 16th c., they were expelled by Frickershausen, Zuirich, Geneva, Thurgau, and other places. Their treatment was more humane in Poland and Lithuania. As early as 1294 A.D., they enjoyed in these countries certain important privileges. Favoured by Casimir III., their numbers were swelling, after 1348 A.D., by fugitives from Germany and Switzerland.—Russia and Hungary, like most other countries of Christendom during the middle ages, received, persecuted, and banished them. In Spain, the condition of the J. was long highly favourable. The horrible persecutions of the Gothic princes in the 6th and 7th centuries, made it, of course, absolutely inevitable that the first glance of a Moorish seaman on the coast would turn them into allies of the invaders. During the whole of the brilliant period of Moorish rule in the Peninsula, they enjoyed, indeed, what must have seemed to them a comparison with their common fate, a sort of Elysian life. They were almost on terms of equality with their Moorish masters, rivalled them in civilitas and letters, and probably surpassed them in wealth. The Spanish J. were consequently of a higher type than those in other parts of Europe. They were not subjected to the one degrading occupation of usury, though
they followed that too; on the contrary, they were husbands, landed proprietors, physicians, financial administrators, &c.; they enjoyed special privileges, and had courts of justice for themselves. Nor was this state of things confined to those portions of Spain under the sovereignty of the Moors; the Christian monarchs of the north and middle gradually came to appreciate the value of their services, and we find them for a time protected and encouraged by the rulers of Aragon and Castile, and they were not the only sufferers and consequent poverty of the nobles, as well as the increasing power of the priesthood, ultimately brought about a disastrous change. The estates of the nobles and (it is also believed) those attached to the cathedrals and churches, were many cases mortgaged to the J.; hence it was not difficult for 'conscience' to get up a persecution, when goaded to its 'duty' by the pressure of want and shame. Gradually, they were deprived of the privilege of living where they pleased; their rights were diminished, and their taxes augmented. In Seville, Cordova, Toledo, Valencia, Catalonia, and the island of Majorca, outbursts of priestly and popular violence took place (1391—1392 A.D.); immense numbers were burned alive, and many others, suspected by the religious rabble. Escape was possible only through flight to Africa, or by accepting baptism at the point of the sword. The number of these unfortunate converts to Christianity is reckoned at 200,000, J. In the late middle ages, in the 15th c., however, beggars description. Persecution, violent conversion, massacre, the tortures of the inquisition—we read of nothing but these! Thousands were burned alive. In one year, 280 were burned in Seville alone. Sometimes the popes, and even the nobles shuddered at the fiendish zeal of the inquisitors, and tried to mitigate it, but in vain. At length the hour of final horror came. In 1492 A.D., Ferdinand and Isabella, moved by a desire of the expulsion, within four months, of all who refused to become Christians, with the strict inhibition to take neither gold nor silver out of the country. The J. offered an enormous sum for its revocation, and for a moment the sovereigns hesitated; but Torquemada, the Dominican inquisitor-general, dared to compare his royal master and mistress to Judas; they shrank from the awful accusation; and the ruin of the most industrious, the most thriving, the most industrious, and the most learned of the subjects—and consequently of Spain herself—became irreparable. This is perhaps the grandest and most melancholy hour in their modern history. It is considered by themselves as great a calamity as the destruction of Jerusalem, of 300,000 (some even give the numbers at 650,000 or 800,000) resolved to abandon the country, which a residence of seven centuries had made almost a second Judaea to them. The incidents that marked their departure are heartrending. Almost every land was shut against them. Some, however, ventured into France; others into Italy, Turkey, and Morocco, in the last of which countries they suffered the most frightful privations. Of the 50,000 who obtained an entrance into Portugal on payment of eight gold pennes a head, but only for eight months, to enable them to obtain means of departure to other countries, many lingered after the expiry of the time, and the year passed away as slaves. In 1493 A.D., King Emanuel commanded them to quit his territories, but at the same time issued a secret order that all Jewish children under 14 years of age should be torn from their mothers, never to be replaced, and kept in Portugal, and brought up as Christians. Agony drove the Jewish mothers into madness; they destroyed their children with their own hands, and threw them into wells and rivers, to prevent them from falling into the hands of their persecutors. The miseries of those who embraced Christianity, but who, for the most part, secretly adhered to their old faith (Onasias, Asumen—yielding to violence, forced ones), were hardly less dreadful, and it was far on in the 17th c. before persecution ceased. Auto da Fé of suspected converts happened as late as 1655 A.D.

The wanderers appear to have met with much better treatment in Italy than anywhere else. During the 15th and 16th centuries they are to be found—except at intervals, when persecution applied its scourgé—in almost every city of Italy; pursuing various kinds of traffic nearly the whole trade of the Levant, for innocent was in their hands), but chiefly engaged in money-lending, in which they rivalled the great Lombard bankers. Abrahanel, perhaps the most eminent Jewish scholar and divine of his day, rose to be confidential adviser to the king of Naples. In Turkey, they were held in higher estimation than the conquered Greeks; the latter were termed Teshir (slaves), but the Jews, Monasphir (visitors); they were allowed to re-open their schools, to establish synagogues, and settle in all the commercial towns of the Levant.

The invention of printing, the revival of learning, and the Reformation, are generally asserted to have been beneficial to the J., but this can be regarded as true only in a certain sense. When the J. began to use the press at their earliest stage for their own literature, sacred and otherwise, the Emperor Maximilian was urged—chided by converts—to order all Hebrew writings to be committed to the flames; and but for the strenuous exertions of Beuchlin (q. v.), ignorance, treachery, and bigotry might have secured a despicable triumph. Luther, in the earlier part of his career, at least, looked with no unfavorable eye on the Jews; and in the later, means for their conversion; and, on the other hand, we find at least one distinguished Roman Catholic, Pope Sixtus V., animadverted by a far more wise and kindly spirit towards them than any Protestant prince of his time. In 1588, he abolished all the persecuting statutes of his predecessors, allowed them to settle and trade in every city of his dominions, to enjoy the free exercise of their religion, and, in respect to the administration of justice, placed them on a footing with the rest of his subjects. That the Reformation itself had nothing to do with subsequent ameliorations in the condition of the J., is only too plain from the fact, that in many parts of Germany, Protestant as well as Catholic, their lot became actually harder than before. They were driven out of Bavaria (1553 A.D.), out of Brandenburgh (1573 A.D.), and similar treatment befell them elsewhere. They also excited numerous popular tumults (as late even as 1730 A.D. in the Protestant city of Hamburg); and, in fact, during the whole of the 17th and the first part of the 18th c., the hardships inflicted on them by the German governments positively became more and more grievous. What really caused the change in their favour was the great uprising of human reason that marked the middle of the 18th century. Among the writers who distinguished themselves in Germany by pleading the cause of the J., we may specially mention Lessing (q. v.), Mendelssohn (q. v.), and Dohm.

Holland, as we know, was one of the first countries in modern times to rise out of the barbarism of the middle ages. Its active, energetic, intelligent inhabitants appreciated the business qualifications of the J., and as early as 1603 A.D., permitted them to settle and trade, though they did not acquire the rights of citizenship till 1706 A.D. In England,
Jews.

The edict of Edward I. remained in force for more than 300 years; and the first attempt made by the J. to obtain a legal recognition in that country was during the Protectorate of Cromwell in 1653 A.D. Cromwell himself was favourable to their admission; so were the lawyers; but the nation generally, and particularly the emphatically religious portion of it, were strongly hostile to such a proceeding; and the wearisome, controversial jangling of the divine appointed to consider the question, proceeded from being due to the reign of Charles II., who, standing much and frequently in need of their services, permitted them quietly to settle in the island. In 1723 A.D., they acquired the right to possess land; and in 1753 A.D., they obtained the right of naturalization. Since 1830, civic corporations, since 1833, the profession of advocates, and since 1845, the office of ablerman and of lord-mayor, have been opened to them. Recently (1858), the last crowning triumph of the principle of toleration was achieved by the admission of J. into parliament.

Some of the relics of that mighty host of exiles that left Spain and Portugal found their way into France and enjoyed there a full right of tolerance—under a miserable condition. In 1550 A.D., they were received into Bayonne and Bordeaux; they were also to be found in considerable numbers in Avignon, Lorraine, and Alsace. In 1784, the capitation-tax was abolished. In 1789, while the French Revolution was still in its pristine vigour, and animated by a sincere humanitarianism, the J. presented a petition to the national representatives claiming equal rights as citizens. Mirabeau was among their advocates, and their number not, therefore, the smallest. From this time, their technical designation in France has been Israélites. In 1806, the Emperor Napoleon summoned a 'Sanhedrim' of J. to meet at Paris, to whom a variety of questions were put, mainly with a view to test their fitness for being French citizens. Their answers were satisfactory, and they were allowed to reorganize their religious institutions in the most elaborate manner. Since then, no material change has taken place in the laws regarding them; and they are since then found not only in the highest offices of the civil administration—very frequently in the ministry (e.g. Crémieux, Gondoin, Fould)—but they also fill some of the chief places in the army and navy. We may add here, that their surpassing bravery in the field has been the subject of frequent remark, more especially since among the vices with which a brutal prejudice loved to brand them, in spite of all historical evidence, was also that of cowardice.—In Denmark, since 1814 A.D., they have been on a footing of equality as citizens with native Danes. —In Sweden, they did not obtain admission till 1776 A.D., and then only into Stockholm and three other towns. Citizenship is still conferred as a favour.—Norway forbade them to touch its soil till 1800 A.D.—Admitted into Russia Proper by Peter the Great, they were expelled— to the number of 35,000—by the Empress Elizabeth in 1749. Resubmitted by the Empress Catharina II., they were further protected by the Emperor Alexander I., who in 1805 and 1809 issued decrees, insuring them full liberty of trade and commerce; but of the liberations recently conferred on them, they were deprived by the late emperor, Nicholas. Since 1833, a scheme of gradual emancipation has been under contemplation.—Poland, however, has become their principal residence. They are no longer numerous than in any other part of the world. They owed their first humane reception in the 14th c. to the love which King Casimir the Great bore for a Jewish mistress. For many years, the whole trade of the country was in their hands. During the 17th and the greater part of the 18th century, however, they were much persecuted, and sank into a state of great ignorance, and even poverty; but education—in spite of the severity and barbarism of Russian intolerance—has, since the French Revolution, made progress among them.—Frederick the Great, king of Prussia, showed himself singularly harsh towards the J.; in fact, his legislation, it has been said, almost throws us back into the middle ages. In the reign of Charles II., the idea of ridiculous taxes were laid upon them; only a certain number were allowed to reside in the country, and these were prohibited both from the most honourable and the most lucrative employments. This shameful state of matters was ended by the Prussian edict of toleration (1812 A.D.), by which J. were placed almost in an equal position as citizens with other Prussians. Since then, the tendency, on the whole, had been to enlarge their 'liberties.' In May 1848, the revolutionary spirit, and the principle of toleration was achieved by the admission of J. into parliament.

In other countries, their condition must be merely referred to. In Turkey, they are very numerous, and have thriven in spite of the exacting of pashas, the insolence of Jauzaries, and the miseries of war. Their communities in Constantinople, Adrianople, Salonniki, Smyrna, Aleppo, and Damascus, are considerable; in Palestine, their ancient home, they are said to be rapidly increasing, but they are still in spite of the many efforts on the part of their European brethren to ameliorate their condition, very poor. Their numbers in Arabia are not very large, yet they enjoy some independence. Those in Persia have sunk into ignorance through oppression, yet it is touching to find that they are not hopeless. Heavy, they say, 'is our slavery; anxiously we wait for redemption.' They exist in Afghanistan, and carry on a trade between Cabul and China; in India and Cochin-China, where they are both agriculturists and artisans; in Surnam, there is a flourishing community; in the Danish settlements, they enjoy equal rights with the other inhabitants, and are skilled in the manufacture of silks and metals; in Tartary and China, where, however, they are very insigificant both in numbers and position. They are also found all along the North African coast, where, indeed, they have had communities for perhaps more than a thousand years, which were largely reinforced in consequence of the great
Spanish persecutions. They are numerous in Fez and Marrakesh, though they are not always free from the perils of Mohammedan fanaticism. In Egypt and Nubia, they are few; in Abyssinia, more numerous; and it is ascertained that they have even made their way into the heart of Africa; they exist in Sudan, and are also found farther south. America, too, has invited their spirit of enterprise. In the United States, as in Great Britain, they enjoy absolute liberty. They have been in Brazil since 1825, in Japan since 1853, and are also settled in some parts of the West Indies.

The entire number of J. in the world is reckoned variously between 3½ and 15 millions. Taking the former estimate, about 1,700,000 belong to Russian, Austrian, and Prussian Poland; about 600,000 to Germany; about 240,000 to Hungary and Transylvania; about 200,000 to Galicia; about 300,000 to Turkey; about 47,000 to Italy; about 30,000 to Great Britain; Asia, about 135,000; Africa, about 504,000; and America, about 30,000. The whole of Europe is supposed to contain about 2½ millions.

 LANGUAGE AND LITERATURE.—Language. Among the Semitic family of languages, the Hebrew (called in the Old Testament the Semitic languages) has the older and more primitive forms. It is one of the oldest, and in regard to strength, refinement, and elaborate completeness of grammatical structure, one of the most remarkable. (Its chief characteristics will be found in the Old Testament, and in the period of the Exile, under the Talmud.) Yet it is neither the oldest of Semitic dialects, nor as was long believed, the first of all human languages. Once identical with the Phenician, it was adopted by Abraham and his family in the patriarchal age, and subsequently kept up as a distinct language, with the law (Mishnah), the prayers, &c., by all the Hebrews. It was adapted to the religious and moral notions of the Hebrews could not but impress upon it by degrees a distinct character, and thus Hebrew became a distinct dialect. Although the Sacred writings are the oldest Semitic works which we possess, there are several characteristics of the Hebrew language which do not at all correspond with any trace of the primitive state of the Hebrew language preserved in them; they belong to periods when it was nearly as fully formed and developed as in the time of the exile. The differences in the religious, literary, and idiom in the different books, must rather be traced to the individualities of the various writers. In general, we distinguish two distinct periods—the golden age, up to the Babylonian exile, when, except a few Egyptian words, no foreign admixture mars the purity of the language; the second from the exile downwards, when Persian and Aramaic elements had largely been introduced. As we find it in the Bible, the Hebrew is a poor language enough; yet there is a sublime grandeur, and, in the provinces of religion and agriculture, also a richness inherent in it which surpasses almost every ancient and modern language. It is hardly to be presumed, in the absence of distinct traces, that there is a language in the small compass of Palestine, room for several dialects. The different pronunciation of the Sibra allied to in Judges xxii must have been only a solitary peculiarity of the Ephraimites, as, at a later period, the Galileans, and also the inhabitants of Jerusalem, were known for their faulty pronunciation, as shewn in several passages of the New Testament and the Talmud. The Hebrew character still universally employed in writing, and called square, Assyrian or Babylonian character, first takes the place, at an uncertain period after the exilc, of the older national alphabetic character, which was common in the age of Moses, and in any case was similar to the old Phenician.

A grammatical treatment of Hebrew first commenced after the language ceased to be spoken by the people. The vocalisation and accentuation of the text originated in the 6th and 7th centuries after the time of Christ. Some of the Christians made the first attempt at a system of grammar about the dawn of the 10th c., after the example of the Arabsians, and originally even in the Arabian language. In the 16th century, Isaac Sahagun (died 942 A.D.), Joseph Chagius (circa 1050 A.D.), Abraham ben Ezra (circa 1150 A.D.), and David Kimchi (circa 1190—1200) are held in classic repute as grammarians. The Hebrew dictionary of the latter was long considered the best that had been executed. The founder of the study of Hebrew among Chris- tians was the famous Johann Reuchlin (died 1522 A.D.), who, however, like the grammarians of the next age, Buxtorf and others, strictly adhered to the Jewish tradition and method. A new era began when the study of the other members of the Semitic family of languages, the Syriac, the Arabic, and the Ethiopic, enlarged the Hebraist's field of view; the heralds of this era were the German scholars, Alb. Schultetus (died 1585), and Nath. Meydenbach (died 1798), who sought to remedy the one-sided defective method into which the so-called Dutch school fell by its too exclusive regard for Arabic. Gesenius, however, especially, and with a comprehensive consideration of all the allied languages, devoted his attention to the critical observation and exposition of the individual grammatical facts, and a more just and harmonious explanation of them. Since then, Ewald (q.v.), who treats the Hebrew language, as an organism after the historic-genetic method, has carried the study still further, and in some measure superseded Gesenius. Ewald's Grammatik der Heb. Sprache (Leip. 1844); Gesenius, Hebräische Grammatik (Leip. 1813), the 16th edition by Hédiget (Leip. 1851); are the best known grammars. The most comprehensive Hebrew dictionary is that by Gesenius, entitled Thesaurus Linguae Hebræicae (Leip. 1829—1842); the best of the smaller lexicons are Gesenius's Hebr. und Chald. Lateinswörterbuch über das Alte Testament (2 vols. Leip. 1810—1812; 4th ed. 1834); Winer's Lexicon Manuale Hebræum et Chaldaicum (Leip. 1828); and Fürst's Hebr. und Chald. Handwörterbuch (Leip. 1837—1861). LITERATURE.—The extraordinary influence which the religion of the Hebrews has exercised on Christian and Mohammedan nations, has given a universal significance to their ancient literature. In antiquity and credibility, in the religiousness of its form and the vigor of its poetry, it surpasses the literature of any other pre-Christian people, and thus constitutes both the most remarkable monument and the most authentic source of the early history and spiritual development of the human race. It is true, however, that only a comparatively scanty portion of it has come down to the present day, and even the contents of what is extant have by no means remained unaltered in the lapse of ages. It is quite certain that the Hebrews, in the earliest times, only engraved or cut out on stone, metal, or wood what is said to have been executed in writing; nor is there any trace of a material adapted for the record of lengthy compositions before the reign of David, and even then the writing of books was still a matter of rare occurrence. Besides, several writings of the Hebrews, held to be of ancient date, are believed to betray a later origin than is assigned to them by their contents, their mode of representation, and the character of the language; so that, in truth, we possess nothing which, in its original shape, reaches further back than the
JEWS.

were written. To this period also, if to any, must belong the uncertain performances of the Great Synagogue (q. v.), a body the existence of which, as indicated above, has been doubted by some early critics, but which is now established beyond any doubt. To this the work of completing the cases of the Old Testament is chiefly ascribed. Towards its close (190–170 B.C.), several writers appear in propria persona, as, for instance, Sirach and Aposto.

The composition of the extent works in Hebrew Literature proper would, on this view, extend over a period of nearly 900 years—viz., from the times of David to those of the Maccabees. This period was preceded by a preparatory one of songs, songs, fragmentary historical notices, inscriptions, laws, and probably also priestly registers. The nature and contents of the particular writings are determined by the changing fortunes of the people, who were at first strong and flourishing; then disrupted and weakened; then held in subjection by Assyrian, Egyptian, Babylonian, Persian, Greek, and Syrian rulers; and, finally, once more independent under native kings. Nevertheless, the prevalent ideas and the basis, so to speak, of the whole Hebrew literature, looked at from the merely human point of view—is a passionate enthusiasm for independence, and for the preservation of a nationality founded on their own ideas and traditions; hence its periodicity is of a profoundly religious character. The law and the doctrine are the 'word of God;' the Hebrews are the 'people of God,' his 'chosen people;' their fortunes are as a special source of privileges; and their poetry has God or the nation for its constant theme. In a certain sense, therefore, as we might expect, all the productions of the Hebrew must show a marked similarity to each other; still they can be arranged, according to form and contents, under the five heads—law, prophecy, history, lyric poetry, and speculation. (For a special account of these, see the articles on the separate books of the Old Testament; also Bible, PENTATEUCH, &c.)

The same epoch in which took place the transition from Hebraism to Judaism—the epoch of the captivity—was also that which marked the commencement of Jewish literature, properly so called. Founded on the earlier and more creative Hebrew, and for the most part written in the vernacular language, it is yet qualified by the presence of religious conceptions borrowed from the Persians, of Greek wisdom, Roman law, and, at a later period, of Aramaic, Greek, and of European science; though everything is strictly subordinated to the great ideas of the ancient faith. Since the return from exile, the Jewish—also, but erroneously, called the Rabbinical—literature has, without the slightest external encouragement, actively taken part in the cultivation of the human mind; and in the results of this activity, which are still far from being duly appreciated, there lie concealed the richest treasures of centuries. Jewish literature has been divided chronologically into nine periods.

The first period extends to 143 B.C. After the return from exile, the Jewish people naturally enough became animated by an intense nationality of feeling; they had nearly lost name, country, life, and the same that these were restored again, they strenuously resolved never more to place them in jeopardy. Guided by Ezra, the intellect of the nation began to exhibit surpassing reverence for the Pentateuch, the Law, and the Prophets. Expositions and additions to the earlier history (Midrashim), as well as Greek translations, were executed, and several of the Hagiographies—such as particular psalms, the so-called Proverbs of Solomon, Ecclesiastes, the Book of Chronicles, portions of Ezra and Nehemiah 7—
JEWISH

Hebrew, and instead had adopted the language of whatever country they happened to dwell in. During the 6th c. the Babylonian Talmud was concluded, the Palestinian Talmud having been redacted about a hundred years before. Little remains of the labours of the Jewish physicians of the 7th c., or of the first Geonom or presidents of the Babylonian schools, who first appear 589 a. D. On the other hand, from the 7th to the 9th centuries, the Masora was developed in Palestine (at Tiberias); and, besides a collection of the earlier Haggadas (e.g., Bereaith rabba), independent commentaries were likewise executed, as the Piskea, the Pirke of Ezechiel, etc., see Masorah, Haggadot.

In the fifth period (from 740 to 1040 A.D.), the Arabs, energetic, brilliant, and victorious in literature as in war, had appropriated to themselves the learning of Hindus, Persians, and Greeks, and thus excited the emulation of the oriental J., among whom now sprang up physicians, astronomers, grammarians, commentators, and chroniclers. Religious and historical Haggadas, books of morality, and expositions of the Talmud, were likewise composed. The attainments of Jews, who, according to the age of Anan (circa 750 A.D.), the earliest writer of the Karate Jews, the oldest prayer-book was drawn up about 880 a. D.; and the first Talmudic Dictionary about 900 a. D. The most illustrious Geonom of a later time were Saadia (died 935 A.D.), equally famous as a commentator and translator of Scripture into Arabic, a doctor of law, a grammarian, theologian, and poet; Schemera (died 998), and his son, which in the 10th century, the Masora appertained to the MSS. besides its application to other things, of a Dictionary. From Palestine came the completion of the Masora and of the vocal-sytem; numerous Midrashim, the Hagiographical Targums, and the first writings on theological cossociation (11th), and, in the 9th to the 11th c., Kairwan and Fez, in Africa, produced several celebrated Jewish doctors and authors. Learned rabbins are likewise found in Italy after the 8th c.—e.g., Julius in Pavia, &c. Baris and Dornato were at this time the great seats of Jewish learning in Italy. After the suppression of the Babylonian academies (1040), Spain became the central seat of Jewish literature. To this period belong the oldest Hebrew codices, which have been transmitted to us. The rabbinical school of Hebrew rhyme is a product of the 8th, and modern Hebrew prosody of the 10th century.

The sixth period (from 1040 to 1244 A.D.) is that of Kairean, Fez, and Tripoli, in Africa. During the Spanish Jews busied themselves about theology, exegetics, grammar, poetry, the science of law, astronomy, mathematics, philosophy, rhetoric, and medicine. They wrote sermons, and ethical and historical works. The languages employed were Arabic, Rabbinical Hebrew, and ancient or classical Hebrew. We can only mention here the great doctor, Samuel Halevi (died 1055), &c.; and lastly, the renowned Maimonides (q. v.), whose death closes this epoch. The literature of the French rabbins was more national in its character, and kept more strictly within the limits of the Halacha and Haggada. In France, which combined the literary characteristics of France and Spain, there were cultivated Jewish academies at Louvil, Narbonne, and Nimes, and we find Talmudists, such as Berakha Halevi, Abraham-ben-David, &c. The fame of the Talmudists of Germany, especially those of Meins and Ratisbon, was very great. Among the most illustrious Jewish writers of this period, belonging to that country, are Simeon, the compiler of Yulkut, Joseph Kara, Petachia, &c. Only a few names belong to Greece and Asia; still the Karate J. had a very able writer in Juda Halaasti (1148).

The greatest part of the Feast Day prayers was completed before Maimonides. Many of the works, however, produced between 740 and the close of this period are of great value. The seventh period (from 1294 to 1492 A.D.) bears manifest traces of the influence exercised by Maimonides. Literary activity showed itself partly in the sphere of theologico-exegetic philosophy, partly in the elaboration of the national law. With the growth of a religious mysticism, there also sprang up a war of opinions between Talmudists, Philosophers, and Cabalists. The most celebrated J. of this period lived in Spain; later, in Portugal, Provence, and Italy. To Spain belongs (in the 13th c.) the poet Jehuda Charsia, &c. In the 15th c., a decline is noticeable. Books written in Hebrew were first printed in Spain at Ixar in Aragon (1483), at Zamora (1487), and at Lisbon (1489). During this period, the chief ornaments of Jewish literature in Provence were Moses ben-Abrabam, David Kimchi, Jeruham, Farissol, Isaac Nathan, the author of the Hebrew Concordance. In Italy, Jewish scholars employed themselves with the translation of the Hebrew MSS. into various languages, and the translation of the Talmud, of which an aesthetical character were written by Immanuel ben-Solomon, the author of the first Hebrew sonnets; Moses de Rieti, who wrote a Hebrew Disna Comedia, &c. While France could shew only a few notable authors, such as Isaac Halevi, Meyer, from Rothenburg, Aharon, Isserlin, Lipmann, the most of the Hebrew MSS. belong to this period; but a great part of medieval Jewish literature lies unprinted in Rome, Florence, Parma, Turin, Paris, Oxford, Leyden, Vienna, and Amsterdam.

The eighth period (1492 to 1755 A.D.) is not marked by much creative or spiritual force among the Jews. In Italy and the East (1492), in Germany and Poland (1560), in Holland (1626), Jewish scholars worked printing-presses, while other scholars wrote in Hebrew, Latin, Spanish, Portuguese, Italian, and Judaeo-German. Some of the most eminent theologians, philosophers, jurists, historians, mathematicians, poets, commentators, lexicographers, grammarians, translators, etc., of whom Isaac Abravanel, Elia Mercaci, I. Aruna, J. Chabib, Elia Levita, Obadso Seferno, Joseph Cohen, Gedalja Jahia, Sal. Usque, Asarai de Ross, David de Pomi, and others, were principal, are also to be numbered. Isaac Gana, Luria, Isaac, J. Karo, M. Alsheech, M. Jafe, J. Heller, J. Alkuk Mannesse, D. Israel, Dav. Conforte, Leo de Modena, B. Musaphia, J. Eybeschutz, D. Oppenheim, J. Emden, M. C. Lazzatto, &c.

The ninth period extends from 1755 A.D. to the present time. Encouraged by the spirit of the 18th c., Moses Mendelssohn (q. v.) opened, to his co-religionists, a new era, which, as in the middle ages, first manifested itself in the national literature. Its character, contents, expression, and even its phraseology, were changed. Poetry, language, philology, criticism, education, history, and literature have been earnestly cultivated. The sacred books have been translated by them into the languages of modern Europe, and foreign works into Hebrew; and many of this once proscribed and detested race have taken an important part in the public and scientific life of Europe. Among them are many illustrious names of this last period, who can select only a few, like Exechiel Landan, Elia Wihla, J. Berlin, Mendelssohn, Maimon, Bendavid, Mendez, Beer, Eulach, Senev, S. Dubno, Creizenach, Zunz, Jose, Geiger, Rapaport, Dukes, Zedler, Forst, Sachs, Steinheider, Munk, Salvador, Reggio, &c.
JEWS-JEYPOOR.

—chiefly cultivators of literature, with reference to their own creed and nationality.

Whether names of those who were and are illustrious in general literature, in law, philosophy, medicine, philology, mathematics, belles lettres, &c., we cannot even attempt, since there is not one country in Europe which does not count J. among the greatest and most brilliant representatives of its intellectual progress. Of Germany—considered to be in the vanguard of European learning—Bun- sen says that the greater part of the professors at its universities and academies are Jews or of Jewish origin (Neander, Gans, Benjamin, Weil, Benson, Stahl, Dernberg, Valentin, Lazarus, Herz, &c., &c., &c.),—certainly a most startling fact. Another extraordinary and well-authenticated fact is, that the European press, no less than European finance, which means the front development of all the resources of soil and science for the gigantic enterprises of our day, are to a great extent in their power; while, on the other hand, names like Heinrich Heine, B. Börne, R. v. Enze, Berthold Auerbach, Mendelsohn-Bartoldy, Halevy, Meyerbeer, Moscheles, Joachim, Ernst, Rubinstein, Wieniawski, Grieg, Brahms, Giedanli, Czajka, Costa; Rachel, Davison, Bött, Dessoff; Bendainem, &c., are familiar to English ears, who shines all branches of art: music, sculpture, painting, the drama, &c., shew plainly how unjust is the reproach of their being an 'abstract' people, without sense for the higher mode of life and the arts that embellish it. Briefly—they are, by the unanimous verdict of the historians and philosophers of our times, reckoned among the chief promoters of the development of humanity and civilisation. What has been their reward, we have seen. Horrible has been the punishment for sins and shortcomings, real or imaginary, over which both Christians and Mohammedans have thought good, at different periods, to constitute themselves judges; and the most hideous spot in the history of the last 2000 years is the systematical but futile endeavour to sweep the 'chosen race' from off the face of the earth.

If there is agradation in sufferings, Israel has reached the highest scene; if the long duration of a war is atoned for by the patience with which they are borne, ennobles, the Jews defy the high-born of all countries; if a literature is called rich which contains a few classical dramas, what place deserves a tragedy that is millennium and ageless, and enacted by the heroes themselves? With these grand words of Zunz (Syngogue Poetie) we conclude our brief sketch: proudly pointing to the final triumph of humanity which belongs to our own day and generation.

JEWS, in point of law, are now, if natural-born subjects, on nearly the same footing as English subjects, the following peculiarities only being noticeable. By the 8 and 9 Vict. c. 52, they were allowed to hold offices in municipal corporations, on condition of the payment of the usual oaths not to exercise their influence so as to injure or weaken the Protestant Church. By the statute 9 and 10 Vict. c. 59, they were placed, as regards local schools and places of worship, on the same footing as Protestant dissenters. Before 1845, doubts had prevailed whether the marriages previously celebrated in England among the J., according to their own usages, were valid, and the statute 10 and 11 Vict. c. 59 put an end to such doubts, by declaring all such marriages valid, provided both the parties had been persons professing the Jewish religion. But now, as then, though it is competent for J., like other dissenters, to superannad any religious ceremony they please to their marriage, there must in all cases be notice given to the registrar of the district of such marriage being about to take place, the only exemption being that the marriage may be celebrated in the synagogue, and not, as in the ordinary case, in the superintendent's registrar's office, or a registered building. A licence must be obtained from the superintendent registrar, and the secretaries of the respective synagogues are recognised as the persons to keep the register books of the Jewish marriages. In Scotland, there is no peculiar legislation affecting Jewish marriages, but Jewish counsel, marriage, etc., is taken at the statute 21 and 22 Vict. c. 49, s. 5, which substituted one oath for the oath of allegiance, supremacy, and abjuration, an extension of the 8 and 9 Vict. c. 52 was made, to suit the case of the J. In all cases where the declaration set forth in the law, w as at the same time an assimilation, that is, not merely as regards municipal offices, but all other offices where the same declaration is required, a Jewish subject is entitled to be admitted on making the declaration substituted by the statute 21 and 22 Vict. c. 49, which enables either House of Parliament, when a Jew would be entitled, to take the oath of allegiance, to sit and vote in the House, and to support by oath by conjuring 'and I make this declaration upon the true faith of a Christian.' When these words are omitted, a Jew has no longer any conscientious objection to take the oath, and so is practically admitted, like other subjects, to become a member of either House of Parliament. It is, however, still in the discretion of either House to refuse to make the resolution to omit these words, so that J. have not an absolute right to admission, though practically it is not likely that the admission will in future be refused, at least by the House of Commons. The same act specially excludes J. from holding or exercising the office of guardians and justices of the United Kingdom, or of Regent of the Royal Kingdom, or of Lord High Chancellor, Lord Keeper or Lord Commissioner of the Great Seal of Great Britain or Ireland, or the office of Lord Lieutenant or deputy, or other chief governor or governors of Ireland, or Her Majesty's secretaries of State, or the office of Lord High Chancellor, or Lord Keeper or Lord Commissioner of the Great Seal of Great Britain or Ireland, or the office of Lord Lieutenant or deputy, or other chief governor or governors of Ireland, or Her Majesty's secretaries of State, or the office of Lord High Chancellor, or Lord Keeper or Lord Commissioner of the Great Seal of Great Britain or Ireland, or the office of Lord Lieutenant or deputy, or other chief governor or governors of Ireland, or Her Majesty's secretaries of State, or the office of Lord High Chancellor, or Lord Keeper or Lord Commissioner of the Great Seal of Great Britain or Ireland, or the office of Lord Lieutenant or deputy, or other chief governor or governors of Ireland, or Her Majesty's secretaries of State, or the office of Lord High Chancellor, or Lord Keeper or Lord Commissioner of the Great Seal of Great Britain or Ireland, or the office of Lord Lieutenant or deputy, or other chief governor or governors of Ireland, or Her Majesty's secretaries of State, or the occasion of being allowed any right of representation to any ecclesiastical corporation, or the right of making any contract for the Archbishops of Canterbury for the time being.

JEWS-HARP (Fr. jeu, a toy!'), a very simple musical instrument, made of metal. When played on, it is held between the teeth, and the sound is produced by the inhaling and ejecting of the air from the lungs, while at the same time an elastic band, which is fixed in the middle of the frame, is set into vibration by being twirled by the finger. It is a pretty old invention, and is mentioned by Pratour in his Organographie. Perhaps the best Jews-harps are made in Riva, a town in the Italian Tyrol. The first performer of any celebrity on the Jews-harp was a Prussian soldier, under Frederick the Great. The harp is an instrument of worship in the synagogues of all schools of Judaism, and of Christianity, and of Mohammedanism. It is the favourite instrument of the Abbé Guizot, and others, were famous for using a variety of harps, all differently tuned; and their performances were so wonderful, that, like other artists, they travelled over Europe, and appeared at public concerts with great success.
regularly built of the native towns of India, stands about 500 miles to the north-west of Calcutta, in lat. 26° 56' N., and long. 75° 5' E. The place is a rectangle of two miles by one, being subdivided by parallel streets in both directions into small rectangular blocks, the palace and gardens occupying the centre. Besides numerous temples and mosques, there are an arsenal and an observatory. The state of Jeypoor is situated in Rajpootana, contains 12,251 square miles, and nearly 2,000,000 inhabitants.

JHANSI, a fortified town in Bundelcund, stands in lat. 29° 28' N., and long. 78° 38' E. It carries on a considerable trade, being on the main route between the Deccan and the Doab. During the revolt of 1857, the native garrison murdered all the Europeans, men, women, and children, not leaving one to tell the tale. In the following April, the place was recovered, with enormous loss on the part of the insurgents, by a detachment of the Bombay army under Sir Hugh Rose. The state of Jhansi has an area of about 2,500 square miles, and a pop. of 200,000.

JHE'LUUM, the ancient Hydaspes, one of the rivers of the Punjab. It rises in Cashmere, which forms its upper basin, and is navigable within that country for about 70 miles. On emerging from the Himalaya through the Baramula Pass, it again becomes practicable for small craft. After a course of 490 miles, it joins the Chenab, in lat. 31° 10' N., long. 77° 45' E., and forms with it what is sometimes called the Trinah or Trinam. The banks of this river were the scene of the battle between Alexander the Great and Porus. The river waters the towns of Isalamabad, Shahabad, Srinagar, Jelahpur, and Fuddad Khan.

JIB, a triangular sail borne in front of the foremost in all vessels. It has the bowsprit for a base in schooners and vessels of a smaller class, and the jib-boom in larger vessels, and excites an important effect, when the wind is a-beam, in throwing the ship's head to leeward. The flying jib has the flying jib-boom for a base. When a fore-curse is not used, an additional jib-shaped sail, called the foresail, is spread on the fore-stay.

JIB-BOOM, an extension of the bowsprit of a ship towards the front, running out beyond it, by a cap and iron as does the topsail above the lower-mast. It gives greater spread for jib-sails, and a more extended base for the top-gallant-mast-stay. In large vessels, a flying jib-boom is run out in a similar manner beyond the jib-boom.

JIBING. See GYBING.

J'IDDAH, or JEDDAH, a trading town of the Hedjaz, Arabia, is situated on an eminence rising from the eastern shore of the Red Sea, about 60 miles west of Mecca, of which city it is the port. It is an unhealthy town; it suffers greatly from want of water, and is surrounded by a desert. It has, however, long been the great commercial centre of Arabia. It imports corn, rice, butter, and other natural productions from Egypt and Abyssinia, manufactures from India, and slaves from the Malay Archipelago. Coffee is largely exported. It is inhabited by a fanatical population, and its religious enthusiasm is never allowed to wane, owing to the number of pilgrims to Mecca who are constantly pouring through it. On the 13th June 1858, the inhabitants rose against the Christians resident among them, and massacred a considerable number of them. In August of the same year, the town was bombarded by the British, and satisfaction rendered. The population fluctuates between 10,000 and 20,000 and upwards.

JIG. See GIGG.

JIGGER. See CHIGG.

Jigger, on board ship, an apparatus consisting of a strong rope with a block at one end, and a sheave at the other, used in maintaining the topsail blocks of— or, technically, in 'holding on to'—the cable as it is thrown off from the capstan or windlass, round which it only takes two or three turns.

J'NA. See JAINAS.

JITOM'FR, chief town of the government of Volynia, in European Russia, is situated on the river Teterov, affluent of the Dnieper, lat. 50° 15' N., long. 28° 40' E.; distance from St Petersburg, 802 miles; pop. in 1858, 33,717. Its foundation is traced back as far as the 10th c., and it was at one time an important stronghold against the invasions of the Cossacks. In 1642, it was nearly destroyed by the Cossack chief Khmelnytsky. In 1793, it was annexed to the Russian empire, as chief town of the government of Volynia. The town carries on a trade in leather, wax, honey, salt, and tallow, has four annual fairs, carries on iron and glass works, and extensive cloth manufactures.

JOAN, POPE, the name of a supposed female occupant of the papal chair in the 9th century. The popular story represents this singular personage as of English parentage, but educated at Cologne, Rome, and ultimately Athens, in all which places in the assumed character of a man, and under the name of Joanus Anglicus, 'John of England,' she is alleged to have attained great distinction as a scholar. The narrative adds, that having come in the end to Rome, she had ability and adroitness enough to carry the deception so far as to obtain holy orders, and to rise through various gradations to the papal sovereignty itself; but that being nevertheless of unmoral life, the fraud was at length discovered, to the infinite scandal of the church, by her becoming pregnant, and being seized with the pains of childbirth on occasion of a spiritual procession. The story is merely an old one, certainly, in the latter part of the 13th century. It was inserted, though discredited, by Platina in his Lives of the Popes, but the statement does not appear to have been much discussed until the 16th c., when the commentator of Platina, Panvinius, inserted a note in refutation of it. Later Roman Catholic historians of course have published replies to the objections against the papal succession which their adversaries drew from the story of the female pope; but it is curious that the most complete and
JOAN OF ARC—JOB.

elaborate investigation of the question was that of a Calvinitc divine, Blondel, who demonstrated the historical groundlessness of the story. He was followed on the same side by Leitz, and although attempts have been made from time to time by a few writers to maintain the tale, it has been all but universally discarded, its latest partisan being Professor Kist of Leyden, who, but a few years since, devoted an elaborate essay, *Fascis Joanae*, to the subject. A few words will suffice to explain the state of the historical evidence. The place assigned to the supposed papers is between the historical papers, Leo IV. and Benedict III., the latter of whom died March 10, 858. It is alleged that the Joan of the story occupied the papal chair for two years and five months. Now, according to all the chroniclers, with the doubtful exception of Milan, 14th, Leo IV. did not die till July 10, 855, so that the interval between his death and that of Nicholas I, the successor of Benedict III., would be entirely filled up by the two years and five months of the papers, and no room would be left for the undoubted authenticity (of two and a half years) of Benedict III. Further, Hunimar of Rheims, a contemporary, in his 26th letter to Nicholas I., states that Benedict III. succeeded Leo IV. immediately. It is proved, moreover, by the unquestionable evidence of a diploma still preserved, and of a contemporary coin which Girampi has published, that Benedict III. was actually reigning before the death of the Emperor Lothaire, which occurred towards the close of 855. The earlier authorities for the story of Pope J., not reckoning a more than doubtful MS. of Marianus Scotus, are Martinus Polonus, a writer of the latter part of the 12th c., and a writer named Stephen de Bourbon, who wrote about 1225. See Gieseler, Kirchenpapiete, th. ii. b. ii. s. 5; also Wenzing, *Ober de Passia Joana*—in reply to Kist—(Gravenhage, 1845); and Bianchi Giovini, *Esame Critico degli atti relativi alla Papessa Giovanna* (1850).

JOAN OF ARC (Fr. Jeanne Darce), the Maid of Orleans, was the daughter of respectable peasants, and was born in 1412, in the village of Domremy, in the department of Vosges, France. She was taught, like other young women of her station in the town and to spin and to read and to write. She was distinguished from other girls by her greater simplicity, modesty, industry, and piety. When about thirteen years of age, she believed that she saw a flash of light, and heard an unearthly voice that enjoined her to be modest, and to be diligent in her religious duties. The impression made upon her excitable mind by the national distresses of the time, soon gave a new character to the revelations which she supposed herself to receive, and when fifteen years old, she imagined that unearthly voices called her to go and fight for the Dauphin. Her story was at first rejected, as that of an insane person; but she not only succeeded in making her way to the head of the French troops, whom her example and the notion of her heavenly mission inspired with new enthusiasm. On 29th April 1429, she threw herself, with supplies of provisions, into Orleans, then closely besieged by the English, and from the 4th to the 8th of May, made successful sallies upon the English, which resulted in their being compelled to raise the siege. After this important victory, the national ardour of the French was rekindled to the utmost, and Joan became the dread of the previously triumphant English. She conducted the Dauphin to Rheims, where he was crowned, 17th July 1429, and Joan, with many tears, saluted him as king. She now wished to return home, deeming her mission accomplished; but Charles implored her to remain with his army, to which she consented. Now, however, because she no longer heard any unearthly voice, she began to have fearful forebodings. She continued to accompany the young king in the perilous expeditions, till, on 24th May 1430, she threw herself, with a few troops, into Compiegne, which the Burgundian forces besieged; and being driven back by them in a sally, was taken prisoner, and sold by the Burgundian officer to the English for a sum of 16,000 francs. Being conveyed to Rouen, the headquarters of the English, she was brought before the spiritual tribunal of the Bishop of Beauvais as a sorceress and heretic; and after a long trial, accompanied with many shameful circumstances, she was condemned to be burned to death. She recanted her alleged errors at the stake, and expressed penitence, in the hope of having her punishment commuted into perpetual imprisonment. But that did not accord with the views of those in whose power she now was. Words which fell from her when subjected to great indignities, and her resumption of male attire when all articles of female dress were taken from her, might have been construed of concluding that she had relapsed, and she was again brought to the stake, on 30th May 1431, and burned. Her family, who had been embonpointed upon her account, was, in 1440, a revulsion of her trial; and in 1436, she was formally pronounced to have been innocent. Few facts in history seem better authenticated than the death of the Maid at Rouen in 1431, and yet great division of opinion exists among critics. There was a popular belief to the time that some one had been executed in the place of Joan; and many pretended Maids appeared, who, however, were punished as impostors. But a Father Vignier, in the 17th c., published among the statutes of the town of Metz, a paper purporting to be written at the time, and giving an account of the arrival at Metz, on the 29th May 1436, of the Maid Jeanne, who was at once recognized by her two brothers, and was subsequently married to a Sieur de Harp, and to this he afterwards found in the family muniment-chest of a M. des Armoises, in Loraine, a contract of marriage between Robert des Armoises, Knight, with Jeanne D'Armoises. But the Maid of Orleans could not have been a subject to this, there was found, in 1749, among the archives of the Maison de Ville of Orleans, under the dates 1435, 1436, a record of certain payments to a messenger bringing letters from Jeanne the Maid, and also to her brother John du Lils or Lys. (De Lys was the name by which the family of Dar was embonpointed.) A subsequent entry, 1st August 1439, records a gift on the part of the council of the city for services rendered her by the sieur M. Depeire, who has discussed the subject in his *Doutte historique* (privately printed, 1855), adduces various other facts tending to the same conclusion.

JOB (Heb. Jôb), derived by Gesenius from jobb, 'to be poor,' 'to be meek,' hence (passive 'one who has an adversary,' or 'a persecuted one'), the leading personage in one of the canonical books of the Old Testament, which is called after him. He is said to have lived in the land of Uz (Sept. *Assi*), of Phil. v. 19, 29), a locality somewhere between Idumea, Palestine, and the Euphrates. Whether Job was a real or a fictitious personage, has been discussed with superfluous animation by critics. The Talmud (Baba Batra, v. 1) holds that *job was never was, and never was created, but is an allegory.*
JOBS TEARS—JOGGLE.

The belief of most scholars at present is, that the Book of Job is a great dramatic poem, built on a basis of historical tradition. Job is a real person in precisely the same sense as the Hamlet of Shakespeare is a real person; i. e., for each there is a certain genuine groundwork of antique fact; but some of the incidents, together with the sentiments and speeches recorded, are purely imaginative. Who was Job? the son of Ziphah, a Calebite; or, at any rate, not has been determined, with exactitude. Some critics make him anterior to Moses; the LXX. identifies him with Jobab, king of Edom, {4} (Post. to Job); others, among whom are many of the Talmudical authorities, regard Moses himself as the author. The Mosaic period is claimed for it by Saadia, many of the church fathers, Michaelis, Jahn, Hufnagel, &c. A nearer approximation to what would seem to be the truth is the view held by Gregory Nazianzen, Luther, Diéderlein, and others, who assign the work—which shows a certain affinity with the Proverbs—to the age of Solomon, when Hebrew poetry was in its full bloom, and a broad catholic spirit pervaded the nation; some have even given Solomon himself the credit of its composition. The reference to the god of Ophir seems at least conclusive against any hypothesis that would place its composition earlier; and wise counsel in Ezekiel, Jewish passages in Isaiah, Amos, which point to an acquaintance with it, go far to prove its comparatively early existence, Rénan, a recent French critic, considers that it belongs to the first half of the 9th c. e.; Ewald pronounces it for a later period, and assigns the poem to the beginning of the 7th century. This date is also advocated by Dr. Samuel Davidson in his Introduction to the Old Testament (Lond. 1852). Others, among whom Chéruy, Verheggen, Wette, Schottmann, Umbreit, Knobel, De Wette, &c.,—place it in the period of the exile; Hartmann, Vatke, Reiter, and others, in the 5th Christian century.

The earlier German scholars, Herder, Eichhorn, &c., looked upon the author as an Elotite—not a Hebrew at all; but this view is now generally, if not entirely, abandoned. The poem is a genuine product of the Hebrew muse, not, however, standing on narrow national ground—the very scene being laid in a foreign country—but on the broad ground of a universal humanity—it is the attempt of a Hebrew thinker, of enlarged mind, to vindicate the Divine government of the world.

Our work will not allow us to enter minutely into a consideration of the design of the poem, or to discuss the various theories which have been advanced. According to Dr. Davidson, it was 'to demonstrate the insufficiency of the current doctrine of compensation.' It condemns the notion that there is a necessary connection between sin and suffering, and without explaining the cause of the latter in the case of a good man, displays the most sublime trust in the wisdom of the Divine Providence. It exhibits a noble spirituality; and in several places, the mysterious contradictions of life seem to awaken in the soul of the writer thoughts of another life beyond the grave, in which God will vindicate the righteousness of His ways. As a work both of genius and art, it occupies well-nigh the first rank in Hebrew literature, and is unsurpassed in sublimity of imaginative thought by any poem of antiquity. The language is elaborate and artificial in the highest degree, yet grave and simple withal, betokening not a primitive period in Jewish history, but one highly advanced. The dramatic construction of the poem indicates the same thing. It has a prologue and a pædagogue, the dialogues by are arranged into three series, as they may be termed, acts; each of these, again, consists of three speeches by Job's friends, with three replies by Job himself, which, by a little stretch of fancy, we may describe as separate scenes. The poem (properly so called) opens and closes with a monologue by the author of the piece. The different character of the persons introduced is skillfully observed; their words have a rhythmical flow; and the dialogues are even strophically divided (see Ewald, Die Dichtung des Jer. Job überetzt und erklärt, Berlin, 1854). The integrity of the poem in its present form has been strongly questioned by many critics; the inferiority (in a literary and poetical point of view) of the passages containing the speeches of Elihu (xxxii.—xxxiii.), no less than the nature of the prologue and epilogue, are thought to indicate that these passages are the work of a later hand. Compare the commentaries of Schulten, Bertram, Eichhorn, Rosenmuller, Ewald (with translation), Umbreit, De Wette, Hitzel, Stetkel, Schlottmann, Rénan (with an admirable translation into French), Lec, &c.

JOBS TEARS (Coix lachrymae), a corn-plant of India. It is a grass, sometimes rising to the height of eight feet, but more commonly half a yard, to which also it is botanically allied; but the male and female flowers grow close together in spikelets, which are produced in axillary clusters. The name is derived from the tear-like form of the hard, shining, bluish-white seeds, which are sometimes made into bracelets and necklaces, and are also an article of food. This plant is cultivated to some extent in many parts of India, but it is one of the worst of the cereals. It has become almost naturalised in Spain and Portugal, and flour made from it is there used, but it is chiefly a resource of the poor in times of scarcity.

JOELIN, a peculiar manner of singing with the falseto voice in harmonic progressions, which exists only among the Tyrolese and the Swiss.

JOEL (Jehovah is God), the son of Pethuel, one of the twelve Minor Prophets, who delivered his predictions, according to some, in the days of Josiah; however, he is placed by Ewald, Umbreit, Schottmann, &c., in the time of Hezekiah, Manasseh, Josiah, Uzziah, &c. Concerning the circumstances of his life, absolutely nothing is known. The occasion of his prophecy was an extraordinary storm of locusts, which came upon the country in extreme drought, which consumed the land. After describing these judgments, the prophet calls upon his countrymen to repent, and assures them that God is ready to forgive. Extraordinary warmth and tenderness of feeling, with the utmost habit of imaginative belief in the glory of the future destiny of the people, run through the whole of the book. Some of the passages have been understood by theologians as predictive of the blessings of the Masonic age, and one is actually applied by the apostle Peter to the events which transpired on the day of Pentecost (Acts, x. 16—21). The style of J., always vivid and eloquent, sometimes sublime, is perhaps the very finest of any of the writers of the Old Testament. One of the most elaborate works on J. is Croxden's Der Prophet Joel. Compare also Ewald, Umbreit, Henderson, &c.

JOGLE, in Masonry, is a notch or curve in the

JOHANNA—JOHN.

form. The joint-joint is commonly used in straight 

Jules, for this purpose, as in fig. 2. Joggles are 

JOHANNA, one of the Comoro Islands (q. v.).

JOHN, the Apostle and Evangelist, was the son of 

John, and John. First used by heresy, and where very tight 

joints are required to resist 

water, &c. Sometimes the 

joint consists of a piece of 

hard stone let into a groove 

and mortice in both the stones forming 

the joint (see fig. 3).

JOHN, the Apostle and Evangelist, was the son of 

Zebedee, a fisherman of the Sea of Galilee, and of 

Salome. He was born at Bethsaida, and, till he 

was called by Jesus to be his disciple, seems to have 

followed his father's occupation. The events of his 

life, from this time to the accession of Christ, are 

to be learned from the gospels. After the out- 

pouring of the Spirit on the day of Pentecost, he 

appears to have laboured for the spread of the 

Gospel first in Jerusalem and Samaria, and after- 

wards in Asia Minor. He is represented chiefly in 

Ephesus. During the reign of the Emperor Domitian, he 

was driven by persecution to the isle of Patmos, but 

returned to Ephesus under Nerva, and died there 
at a great age. The dates assigned to this event 
ranged from 89 to 120 A.D., and in any case he 
must have long survived his brother apostles. It 

is believed that he was the only one of our Lord's 
apostles who died a natural death. Tradition 

accounts for this by representing his life as miracu- 
lously preserved. He is represented in Scripture 
as of a peculiarly affectionate nature, 'the 
disciple whom Jesus loved;' and tradition makes 

his last words to have been, 'Little children, love 
one another.' The works attributed to him are the 

Gospel, the three Epistles of St John, and the book 
of Revelation. The first is generally believed to 

have been written by the apostle at Ephesus 
about 75 A.D., but attempts have been made by 

modern writers to disprove both its Johannine 

authorship and its early origin. The Tübingen 
school, headed by Baur, place its composition in 

the middle of the 2d c., and assert that it obviously 

rose out of the conflicts of opposing teachers. 

This view, however, is rejected by the greatest critics 

and scholars of Germany, and its Johannine 

origin is now admitted. The three so-called Epistles 
of St John do not stand on exactly the same footing. 

It is highly probable that the Fourth preceded the 

same writer who composed the Gospel. In style, 

language, and doctrine, it is identical with it, and 

from the earliest times it was quoted as a work of 

the Apostle John's; but the Second and Third are 

classed by Eusebius among the Antilegomena (Script- 
tures of doubtful genuineness), and were suspected 

by the most learned and critical of the early Fathers. 

For an account of the Book of Revelation, see 

Revelation, Book of.

JOHN, the name of a long line of popes, the 
members of which are variously stated by 
different historians, owing to some uncertainty as to 

the designation of two of the popes in the series—John 
VIII. (872—882), who is styled the IX. by some 

writers, who, accepting the theory of Pope John 

(q. v.), reckon her as John VIII.; and John XV. 
(985—996), who is also called XVI. by those who 

place before him another John who died within a 

few days of his election. Without entering 

into this question, it will suffice to say that the 

largest number of popes called John is John XXIII. 

The following appear to deserve some special 

notice.—John XII. was the son of Alberico, and 
grandson of the notorious Marozio, who, during 

the pontificate of John X. (911—928), ruled with 
almost supreme power at Rome. John was origin- 
ally named Octavius, and on the death of Pope 

Agapetus, in 956, being elected pope through the 
lawless intrigue or violence of the dominant party, 

when only in his 19th year, was the first in the 

papal line to originate the now familiar practice of 

changing his name. His life, according to accounts 

which it is impossible to discredit, was what might 

be expected from one such antecedents of sin and 

disorder; and although he had crowned Otho 

emperor and king of Italy in 962, that monarch, 
in 963, in a synod of the clergy, overstepping all 

the ordinary rules of canonical procedure and 

precedent, caused sentence of deposition for scan- 
dalous life to be pronounced against John, and Leo 

VIII. to be elected in his stead. John, however, 

re-entered Rome in the following year with a strong 
party, and drove out Leo; but his career was 

short by a dishonourable death. He was killed, 

according to Luitprand, while prosecuting an unlaw- 

ful intrigue in 964. In his effeminacy or licentious- 

ness, Pamvota and other historians find the origin 

of the nickname of Pope John.—John XXII. is one of 

the most celebrated of the popes of Avignon. His 

family name was James de Cahors, and he was 

elected pope in 1316, on the death of Clement V. 

Attempting to carry out, in very altered circum- 
stances, the schemes of the past and contemporary 

of Gregory VII. and Innocent III., John interposed 

his authority in the contest for the imperial crown 

between Louis of Bavaria and Frederick of Austria, 

by not only recognizing the successor of the 

Lombards, but also the candidate of the French 

of Avignon, where the Guelph or papal party was represented 

by Robert, king of Naples, Frederick of Sicily being 

the chief leader of the Ghibellines. The latter was 

placed by John under the same ban which had 

already been pronounced against Louis; but in 1317, 

Louis came to Italy in person, and having been 

crowned at Milan with the iron crown, advanced 

upon Rome, expelled the papallegate, and was 
crowned emperor in the church of St Peter's by 

two French cardinals. Immediately on his corona- 
tion, he proceeded to hold an assembly, in which 

he caused the pope, under his original name of 

James de Cahors, to be thrice summoned, to answer 

for a charge of heresy, and the consequences of 

which he caused him to be deposed, and Peter de 

Corvara, a monk, to be elected pope, under the 

name of Nicholas V. These measures, however, 

were attended with little result. Louis returned to 

Germany, and the Guelphic predominance at Rome 

was restored, the papal representative resuming his 

authority. But John XXII. never personally visited 

Rome, having died at Avignon in 1334, when, 

although without incurring the suspicion of personal 

aggrandisement, he had accumulated in the papal 

treasury the enormous sum of 18,000,000 florins of 

gold. This pope is remarkable in theological history 

as the author of that portion of the canon law called 

the Extraconcordatus, and also as having held the 

simple opinion, that the just will not be admitted to 

the beatific vision until after the general resur- 

rection. This opinion he formally retracted before 

his death.

JOHN, surnamed Lackland, king of England, 

and the youngest of the five sons of Henry II. by 

his wife, Eleanor of Guienne, was born at Oxford, 

24th December 1166. His father having obtained 

a bull from the pope authorising him to invest 

one of his sons with the lordship of Ireland, J. 

was appointed in a council held at Oxford in 1178, 

and in March 1185 he went over to take the reins of
JOHN.

government, but governed so badly that he was recalled in the following December. J. latterly united with his brothers in their rebellions against their father, and it was the sudden communication of the news of his having joined his brother Richard's rebellion that caused the death of Henry.

When Richard I. succeeded to the crown, he conferred upon his young brother earldom, which amounted (as most men supposed) to a dismemberment of the kingdom. This did not, however, prevent J. endeavouring to seize the crown during Richard's captivity in Austria. J. was, however, paroled, and treated with great leniency; but he is said to have subsequently assumed his brother's name, by his brother on his deathbed. J. hastened, at his brother's death, to obtain the support of the continental barons, and then started for England, and was crowned at Westminster, in January 1199; he was then said to have been married to his brother's wife, and on his deathbed he married her, and continued to bear the name of Geoffrey. When Richard I. recovered his kingdom, with the aid of Philip Augustus, he had crossed the Channel, and sailed to France, where he was met by the English army, and by the clergy of the Pope, who would not receive him as the lawful heir to the throne. Richard I. had been placed on the throne by the clergy of the Pope, and he had returned to England with the aid of Philip Augustus, and had been proclaimed by the clergy of the Pope, and had been crowned as King of England, and he had been married to his brother's wife, and had been declared the lawful heir to the throne. When Richard I. died, he was succeeded by his son, who was known as John, and he was crowned at Westminster, in January 1199; he was then said to have been married to his brother's wife, and on his deathbed he married her, and continued to bear the name of Geoffrey. When Richard I. recovered his kingdom, with the aid of Philip Augustus, he had crossed the Channel, and sailed to France, where he was met by the English army, and by the clergy of the Pope, who would not receive him as the lawful heir to the throne. Richard I. had been placed on the throne by the clergy of the Pope, and he had returned to England with the aid of Philip Augustus, and had been proclaimed by the clergy of the Pope, and had been crowned as King of England, and he had been married to his brother's wife, and had been declared the lawful heir to the throne.

1800, he received the command of the defeated Austrian army, formerly under Kray. His military career was not brilliant. He was defeated at Hohenlinden in 1800, and at Austerlitz in 1805. In the war of 1809, he advanced with an Austrian army into Italy, defeated the viceroy Eugene at Saccile, and made his way as far as the Adige, when the reverses of the Austrian forces at Lainzab, Eckmühl, and Hochstadt compelled him to retreat. His love of natural science, for which he manifested an early predilection, continued unimpaired amidst all the vicissitudes of his life; and Austria is many indebted to him for the institutions and enterprises. Living in political retirement, he showed a warm interest in every improvement and public work, and became exceedingly popular; so that when the German national congress assembled after the close of the war, he was the object of a great majority of voices, on the 29th of June of that year, to be Vicar or Regent of the Germanic empire.

The fall of Metternich had also, in the meantime, released him from his political isolation in Austria; and the Emperor, who was now reconciled to him, treated him with every mark of respect, and endeavoured to bring about a reconciliation between himself and the Emperor, and to promote the interests of Austria. He was, in fact, the principal entrepot of all the political transactions of the time, and was, in a manner, the centre of the political world. He was, in fact, the principal entrepot of all the political transactions of the time, and was, in a manner, the centre of the political world.

His marriage was one of an unusually romantic kind. Late on a January evening in 1827, he had occasion to require the services of the postmaster ofAussee, a mountain-village in the vicinity of Grätz. The postmaster was from home; but his daughter, Anna Pfoichl, volunteered to drive him over the hills to his destination. The conversation and spirit of this maiden seem to have charmed the archduke, and within a few weeks he married her. The titles of Countess of Meran and Baroness of Brondorf were subsequently conferred upon this lady. See MORGANIAN MARRIAGES.

JOHN, PRESTER ('Priest John'), the supposed Christian king and priest of a medieval kingdom in the interior of Asia, the locality of which is vague and undefined. In the 11th and 12th centuries, the Nestorians were sent to Eastern Asia, and made many converts among the Keraets or Krit Tartars, including, according to report, the khan or sovereign of the tribe, Ung (or Ughy Khan, who resided at Karakorum, and to whom the afterwards celebrated Genghis Khan was tributary. This name the Syrian missionaries translated by analogy with their own language, converting Ung into 'Jachanan' or 'John,' and reverting Khan by 'Priest.' In their reports to the Christians of the West, accordingly, their royal convert figured as at once a priest and the sovereign of a rich and magnificent kingdom. Genghis Khan having thrown off his allegiance, a war ensued, and the end of the 12th century, to which we owe almost all our knowledge of medieval eastern geography. The reports regarding Ung Khan, carried to Europe by the Armenian embassy to Eugene III., created a most profound impression; and the letters addressed in his name, but drawn up by the Nestorian missionaries, to the pope, to the kings of France and Portugal, and to the Greek emperor, impressed all with a lively hope of the
JOHN—JOHN O'GROAT'S HOUSE.

speedy extension of the gospel in a region hitherto regarded as hopelessly lost to Christianity. They are described as Assam's "Bibliotheca orientalis.

The earliest mention of Prester John is in the narrative of the Franciscan Father, John Carpini, who was sent by Pope Innocent IV. to the court of Batth Khan of Kiptchak, the grandson of Genghis Khan. It is supposed that Prester John's kingdom lay still further to the east, but he did not prosecute the search. This was reserved for a member of the same order, Father Rubruquis, who was sent as a missionary into Tartary by St. Louis, and having reached the camp of Batth Khan, was by him sent forward to Karakorum, the seat of the supposed Prester John. He failed, however, of his hope of finding such a personage, the Khanan of Karakorum, Mangh, being still an unbeliever; and his intercourse with the Nestorian missionaries, whom he found established there, satisfied him that the accounts were grievously exaggerated. His narrative, which is printed in Purchas's Collection, is one of the most interesting among those of the medieval travellers. Under the same vague notion of the existence of a Christian prince and a Christian kingdom in the East, the Portuguese sought for traces of Prester John in their newly-acquired Indian territory in the 15th century. A similar notion is as to the Christian kingdom of Abyssinia, which, in the hope of finding Prester John, was visited so late as the reign of John II. of Portugal (1481—1495) by Pedro Covilham and Alfonso di Payva, the former of whom married and settled in that country. See Geseler's Kirchen-geschichte, III. ii. 43; Ritter's Erdkunde, th. ii. b. i. 256—283.

JOHN, Sr., the commercial capital and largest city of New Brunswick, stands on the north or left bank of the estuary of the river of its own name, in lat. 45° 14' N., and long. 66° 3' W. Pop. in 1861, 27,317. The harbour, which is protected by batteries, is good, and accessible to the largest vessels at all seasons of the year. Ship-building and the timber-trade are the chief branches of industry; 435,601 tons of shipping were entered at this port in 1861.

JOHN, Sr., the most considerable river of New Brunswick, in British North America, rises in a lake of the same name in the state of Maine, and after a south-east course of 450 miles, the largest river which is within British territory, it falls into the Bay of Fundy by an estuary five miles in width. Near the sea, it is navigable for large vessels; while for craft of 120 tons it is practicable as far as Fredericton, which is 80 miles from its mouth, and the seat of the colonial government. The stream is of some historical interest in connection with the long-contested adjustment of the international boundary. Through most of its upper course, it separates Maine from Canada.

JOHN III. (John Sobieski), king of Poland, 1674—1696, one of the greatest warriors of the 17th c., was born in 1624, or, according to others, in 1629, and educated with the utmost care, along with his brother Mark, by his father, Janus Sobieski, Castellan of Cracow, a man of virtuous character and warlike spirit. The brothers travelled in France, England, Italy, and Germany. Their father's death recalled them home in 1648. The Polish army, defeated by the Russians in the battle of Pilsawice, the Sobieskis took up arms to restore the fortunes of their country. Mark fell in battle on the banks of the Breg; John distinguished himself by his valour, and became the admiration of his countrymen and the dread of the Tartars and Cossacks. He received the highest military dignities and appointments, and on 11th November 1683 took the great battle of Choczim, in which they lost 28,000 men; after which he was, on 21st May 1674, unanimously elected king of Poland, and was crowned in Cracow along with his wife, Maria Casimir Lousia, daughter of the Marquis Lagrange d'Arquien, and widow of the woiwode John Zamoiski. When the Turks besieged Vienna in 1683, John hastened thither with 20,000 Poles, and, along with the German auxiliaries who had also come up, raised the siege by the victory of the Battle of Kahlenburg. In this battle, he took the banner of Mohammed, which he sent to the pope. On his entrance into Vienna, he was received with unbounded enthusiasm by the inhabitants. His subsequent undertakings against the Turks were not equally successful. He died of apoplexy on 17th June 1696. John Sobieski was not only a statesman and warrior, but a lover of science, and a man of gentle disposition and agreeable manners; but his constant wars prevented him from spending that attention to the internal strength of his state which its critical situation urgently required, and this oversight on his part helped to hasten the downfall of Poland.

JOHN OF AUSTRIA, or DON JUAN D'AUTRICHE, member of the house of Hapsburg, was born in Regensburg, on 24th February 1486. It is uncertain who his mother was. He was early brought to Spain; and after the death of his father, he was acknowledged by his half-brother Philip II.; henceforth an annual allowance were bestowed upon him, and he was educated along with the Prince of Parma and the Infant Don Carlos. He was intended for the church; but his own inclination was for military employment, and in 1570 he received the command of an army sent against the rebellious Moors in Granada, whom he completely routed out of the country—signalising himself at once by valour and by cruelty. In 1571, he was appointed to the command of a maritime expedition—in which the forces of Spain, the pope, and Venice were united against the Turks—and defeated the Turks in a great battle near Lepanto (October 7). Discord breaking out among the allies, Don Juan separated himself from the rest, took Toledo, and conceived the design of forming a kingdom for himself in the north of Africa. But Philip, jealous of this design, sent him to Milan, to observe the Genoese; and afterwards, in 1576, to the viceroy to the Netherlands. In this capacity, he sought to win the favour of the king by mildness; but being left unsupported by Philip, he was hard pressed for a time, till the arrival of the Prince of Parma with troops enabled him to restore the fortunes of Spain by the victory of Gemblours over William the Silent, in 1577. But Philip was now apprehensive that Don Juan might make himself king of the Netherlands; and the untimely death of the latter in his intrenched camp at Nauplia, on 1st October 1578, was of itself without suspicion of poison. See Dusenelli's Histoire de Jean d'Autriche (2d ed., Paris, 1828).

JOHN O'GROAT'S HOUSE (or, more correctly, it would seem, JOHNNY GROAT'S HOUSE), on Dunsansby Head, the north-eastern extremity of the mainland of Scotland, has been long widely known as marking one of the limits of that country, as in Burns's line:

Freie Maidenkirk to Johnny Groats.'

It stood on the beach at the mouth of the Pentland Firth, and was probably built for the reception of travellers crossing the ferry to the Orkneys. Tradition gives a more romantic origin. In the reign of
JOHN (Sr) OF JERUSALEM—JOHN OF LEYDEN.

King James IV. (1488—1513), three brothers—Malcolm, Gavin, and John Grot or Grot—supposed to be Hollanders, settling in Caithness, acquired the lands of Warse and Dungansby. When their descendants had so multiplied, several eight families, disputes arose as to precedence at a yearly festival which they were wont to keep. John Grot settled the controversy by building an eight-sided house, with a door and a window in each, a form of which he is said to have introduced from the Scottish treasury of £20 to John Grote, for freight of his ship sent by the queen's grace, from St Andrews to Orkney, to the king's grace with writing. In 1547, John Grot had a pardon from Queen Mary, 27th March, 1547, through Earl of Caithness to storm the Earl Marischal's castle of Aikrigill. About 1741, Malcolm Grot sold his lands in Dungansby, with the ferry-house, to William Sinclair of Frewick. The family of Grot still exists; but a small green knoll is all that now remains of John o' Grot's House. The shell Cyprians Europaeus, which abounds in the neighbourhood, has received the name of 'John o' Grot's bucky.'

JOHN (Sr) OF JERUSALEM, KNIGHTS of, commonly called KNIGHTS OF MALTA, and afterwards of MALTA, the most celebrated of all the military and religious orders of the middle ages. It originated in 1095 in an hospital dedicated to St John the Baptist, which some merchants of Amalfi were permitted by the calif of Egypt to build for the reception of the pilgrims from Europe who visited the Holy Sepulchre. The nurses were at first known as the Hospitaller Brothers of St John the Baptist of Jerusalem. The Seljuk Turks, who succeeded the Greek and the Egyptian and plundered the hospice, and on the conquest of Jerusalem by the crusaders under Geoffrey de Bouillon in 1099, the first superior, Gérard, was found in prison. Released from dungeon by his duties in the hospice, gave material aid to the sick and wounded, and was joined by several of the crusaders, who devoted themselves to the service of the poor pilgrims. By advice of Gérard, the brethren took vows of poverty, chastity, and obedience before the Patriarch of Jerusalem. Pope Pascal II gave his sanction to the institution in 1113. Raymond du Puy, the successor of Gérard in the office of superior, drew up a body of statutes for the order, which became the basis of the constitutions of the former orders was afterwards added those of fighting against the infidels and defending the Holy Sepulchre. Various hospices, called commanderies, were established in different maritime towns of Europe, and in every province for pilgrims there provided with the means of setting out for Palestine. The order having become military as well as religious, was recruited by persons of high rank and influence, and wealth flowed into it from all quarters. On the conquest of Jerusalem by Saladin in 1187, the Hospitallers retired to Margat in Phrygia, whence the progress of infidel arms drove them first, in 1280, to Acre, and afterwards, in 1291, to Limassio, where Henry II, king of Cyprus, assigned them a residence. By the statutes of Raymond, the brethren consisted of three classes, Knights, Chaplains, and Serving Brothers; these last being fighting squires, who followed the knights in their expeditions. The order was subsequently divided into eight languages—Provence, Auvergne, France, Italy, Aragon, England, Germany, and Castile. Each nation possessed several Grand Masters, Priories, under which were a number of commanderies. The chief establishment in England was the Priory at Clckenwell, whose head had a seat in the Upper House of Parliament, and was styled First Baron of England.

In 1310, the knights, under their grand-master, Foulkes de Villaret, in conjunction with a party of crusaders from Italy, captured Rhodes and seven adjacent islands from the Greek and Saracen pirates, and from thence a successful war against the Saracens. In 1523, they were compelled to surrender Rhodes to Sultan Solymans, and retired first to Candia and afterwards to Viterbo. In 1530, Charles V. assigned them the islands of Malta, which were a number of commanderies. The knights continued for some time to be a powerful bulwark against the Turks; but after the Reformation a moral degeneracy overspread the order, and it rapidly declined in political importance; and in 1799, through its treachery at the battle of Alexandria, and the cowardice of the grand-master, D'Hempesch, Malta was surrendered to the French. The lands still remaining to the order were also about this time confiscated in almost all the European states; but though extinct as a sovereign body, the order has continued during the present century to drag on a lingering existence in some parts of Italy, as well as in Russia and Spain. Since 1801, the office of grand-master has not been filled up; a deputy grand-master has instead been appointed, who has his residence in Spain. The order at first wore a long black habit, with a pointed hood, adorned with a cross of white silk of the form called Maltese on the left breast, as also a golden cross in the middle of the breast. In their military capacity, they wore red surcots with the silver cross before and behind. The badge worn by all the Knights is a Maltese cross, enamelled white, and edged with gold; it is suspended by a black ribbon, and the embellishments attached to it differ in the different countries where the order still exists.

JOHN OF LEYDEN (properly, JOHN BOLCKEY or BBACKEL) was born at Leyden in 1510. He was the son of a bailiff in the Hague, and of a Westphalian bondswoman. He wandered about for some time as a journeyman tailor, and then settled in Leyden, but was fonder of amusements than of his trade. He possessed some poetic abilities as an actor. Adopting the opinions of the Anabaptists (q. v.), he became one of their wandering prophets. In 1533, he came to Münster, was the chief supporter of Matthiesen or Matthes there, and when Matthiesen lost his life in 1534, he became the bishop of that city. In 1535, he introduced polygamy, and displayed a great love of kingly pomp. The city was the scene of horrid excesses. In June 1535, it was taken by the Bishop of Münster. John and his chief accomplish 121
suffered death with circumstances of fearful cruelty (January 26, 1536), and his body was suspended in a cage from a high tower. He attempted to save his life by confession and submission.

JOHN OF NEPMUK (more properly, Pomuk), a popular Bohemian saint of the Catholic Church, is widely venerated and honoured as a martyr of the inviolability of the seal of confession. He was born at Pomuk, a village in the district of Klatau, about the middle of the 14th century. Having entered into orders, he rose rapidly to the position of being canon and vicar-general of the cathedral of Prague, and eventually vicar-general of the diocese. The queen, Sophia, the second wife of Wenzel or Venceslaus IV., having selected him for her confessor, was the wisest of all the men of most dissolute life, conceiving suspicions of her virtue, required of John to reveal to him what he knew of her life from the confessions which she had made to him. John steadfastly refused, and the king resolved to revenge for the refusal. An opportunity occurred soon afterwards, when the monks of the Benedictine abbey of Kladran having elected an abbot, in opposition to the design of the king, who wished to bestow it upon one of his own disolute favourites, John, as vicar-general, at once confirmed the election. Venceslaus, having first put him to the torture, at which he himself personally presided, had him tied hand and foot, and flung him with all his life into the Moldau, in March 1398. His body, according to the tradition, being discovered by a miraculous light which issued from it, was taken up, and buried with the greatest honour. His memory was cherished with peculiar affection in his native country, and he was eventually canonised as a saint of the Roman Catholic Church, his feast being fixed for the 20th of March. By some historians, two distinct personages of the same name are enumerated: one, the confessor of the confessional, the other of his resistance to the simoniacal tyranny of Venceslaus; but the identity of the two is well sustained by Palacky, Geschichte von Böhmen, iii. 62.

JOHN THE BAPTIST, the forerunner of Christ, was the son of the priest Zacharias and Elizabeth, the cousin of Mary, the mother of our Lord. John and Christ were therefore second-cousins. The wonderful circumstances attending the conception and birth of the former, are recorded in the gospels. The first of St. Luke's evangel. After a life devoted to preparing his countrymen for the coming of the Messiah, he was thrown into prison, and afterwards executed by Herod Antipas. J.'s followers existed as a separate body till long after the spread of Christianity, and a sect still exists in the East professing to be his disciples.—J. the B. was, from an early date, regarded in England as the patron saint of the common people, and on this account, apparently, great masonic festivals are held on St. John's Day, the day dedicated to him, which is the 24th of June.

JOHN THE PARRICIDE, commonly called JOHN OF SWABIA, son of Rudolf I., and grandson of Rudolf I. of Austria, was born in 1259. On attaining his majority, he applied to his uncle, Albert I. of Austria, to resign to him the whole or a part of his patrimony, which consisted of Kyburg and some estates in Swabia; but this Albert refused to do. After making many other abortive attempts to fly, already half dead from the rack, into the Moldau, in March 1398. His body, according to the tradition, being discovered by a miraculous light which issued from it, was taken up, and buried with the greatest honour. His memory was cherished with peculiar affection in his native country, and he was eventually canonised as a saint of the Roman Catholic Church, his feast being fixed for the 20th of March. By some historians, two distinct personages of the same name are enumerated: one, the confessor of the confessional, the other of his resistance to the simoniacal tyranny of Venceslaus; but the identity of the two is well sustained by Palacky, Geschichte von Böhmen, iii. 62.

JOHN OF NEPMUK—JOHN'S.

betaking himself to Italy, where he led a wandering life, and died in obscurity.

JOHN'S, Eve or St., one of the most joyous festivals of Christendom during the middle ages, was celebrated on midsummer eve. From the time of the ancient pagans, it was observed by them as the feast of the Egyptian goddess Sekhmet, in their Decad. Mythologie (I. i. pp. 583—593), it would appear to have been observed with similar rites in every country of Europe. Fires were kindled chiefly in the streets and market-places of the towns, at Pagan watch-keepers' houses. In the province of Mainz, they were blessed by the parish-priest, and prayer and praise offered until they had burned out; but, as a rule, they were secular in their character, and conducted by the laymen themselves. The young people leaped over the flames, or threw flowers and Garlanda into them, with merry shoutings; songs and dances were also a frequent accomplishment. At a comparatively late period, the very highest personages took part in these festivities. In England, we are told (see R. Chambers's Book of Days, June 24), the people on the Eve of St. John's 'were accustomed to go into the woods and break down branches of trees, which they afterwards fetched over their doors, amidst great demonstrations of joy, to make good the prophecy respecting the Baptist, that many should rejoice in his birth. This custom was universal in England till the recent change in manners. Some of the superstitions notions connected with St. John's Eve are of a highly fanciful nature. The Irish believe that the souls of all people on this night leave their bodies and wander to the place, by land or sea, where death shall finally separate the soul from the tenement of clay. It is not improbable that this notion was originally universal, and was the cause of the widespread custom of watching or sitting up awake on St. John's night, for we may well believe that there would be a general wish to prevent the soul from going upon that somewhat dismal ramble. In England, and perhaps in other countries also, it was believed that, if any one sat up fasting all night in the church porch, he would see the spirits of those who were to die in the parish during the ensuing twelve months come and knock at the church door, in the order and succession in which they were destined to die. We can easily perceive a possible connection between this custom and the one that the soul's midnight ramble.' The kindling of the fire, the leaping over or through the flames, and the flower-garlands, clearly shew that these rites are essentially of heathen origin, and of a sacrificial character. They are obviously connected with the worship of the sun, and were doubtless practised long before the Baptist was born. In old heathen times, Midsummer and Yule (q. v.), the summer and winter solstices were the two greatest and most widespread festivals in Europe. The church could not abolish these; it could only change their name, and try to find something in the history of Christianity that would justify the alteration.

JOHN'S, St., a city of the West Indies, capital of the island of Antigua (q. v.), and the residence of the governor-in-chief of the Leeward Islands, is situated at the western side of that island, close to the shore. Pop. 8515. The town is well laid out, having spacious streets, of which the principal runs east and west, and is watered by the Swans River. It makes full advantage of the refreshing easterly or trade winds, which prevail here from April to August. The harbour is comparatively shallow, and there is a bar across the mouth of it, so that vessels heavily laden and bound for the island round her, near the castle of Hapsburg, they knocked, and murdered her, 1st May 1500. The conspirators fled in different directions, J.
JOHN'S—JOHNSON.

house are the chief edifices. Water is scarce here, and in long dry seasons the inhabitants suffer greatly from the want of it. Wells have been sunk in the town, but the water obtained is brackish, so that the wells are not connected with the cisterns and forms the only supply of this invaluable element. The maximum heat is 96°; the minimum, 62°. The average full of rain is said to be 45 inches.

JOHN'S, Sr, the chief town of Newfoundland, stands on the east coast of the island, in lat. 47° 27' N. and long. 53° 33' W. It has an excellent natural harbour, which is well fortified. Pop. 25,000. Being the nearest port in America to Europe (distance 1665 miles), and connected with continental America by telegraph, St John's has recently acquired importance in the commercial and political world in connection with steam-navigation between the two continents. It has suffered severely from repeated confinements; in 1846, it was more than half destroyed.

JOHN'S, Sr, a thriving town of Canada East, is situated on the left bank of the river Richelieu, opposite the town of St Athanas, with which it is connected by a bridge, and 1 miles south-east from Montreal. It contains glass-works, potteries, foundries, saw-mills, &c., and carries on a considerable trade in timber, firewood, horses, and grain. Pop. about 5000.

JOHN'S COLLEGE, or the College of St John the Baptist, Oxford, succeeded an older institution, founded by Archbishop Chichele in 1456, for monks of the Cistercan order. Sir Thomas White procured a licence from King Philip and Queen Mary to found a college, dedicated 'to the honour of God, the Virgin Mary, and St John the Baptist,' on the site of Archbishop Chichele's College. The foundation consists of a president, 30 fellows and scholars, and a body of the fellows are from kin; two from Coventry, two from Bristol, two from Reading, and one from Tunbridge Schools; all the rest are from Merchant Taylor's School. In 1834, four fellowships were added by the will of Dudley Faraday, Esquire. These are open, with a preference, however, first, to founder's kin, and second, to natives of Staffordshire. This college presents to 30 benefices. In 1869, there were about 350 names on the books. The arrangements of this college were not altered by the commissioners under 17 and 18 Vict. 81. The commissioners of 1832, indeed, proposed extensive changes, which the commissioners under the act were disposed to carry out, but the college succeeded in baffling their endeavours. Similar changes, however, to those recommended by the Commissioners—involving, among other points, the throwing open of half the fellowships—have been subsequently introduced by the authority of the Privy Council.

JOHN'S COLLEGE, Sr, Cambridge, was founded in 1511 by Lady Margaret, Countess of Richmond, and mother of Henry VII; but her death happening before the design was completed, her executors, one of whom was Fisher, Bishop of Rochester, carried her intentions into effect. The site of the college had been long before devoted to pious uses, but three times was the disposition of the property altered—1st, when Neal, Bishop of Ely, founded here a hospital for Canons Regular in 1154; 2dly, when Hugh de Balsham made it into a priory, dedicated to St John the Evangelist; 3dly, when Lady Margaret's executors converted it into a college. The foundation is for a master, who is elected by the Society, fifty-six fellows, sixty scholars, and nine proper tithers. There are also numerous exhibitions of considerable value, and eight minor scholarships open every year to competition for students who have not yet commenced residence in the university. Amongst names of interest may be mentioned William Grindal, tutor to Charles I, and made bishop to Queen Elizabeth; Cecil, Lord Burleigh; Richard Bentley (who became master of Trinity College); Kirke White, the poet; Henry Martyn, &c. For full particulars, see Cooper's Memorials of Cambridge.

JOHNSON, Samuel, son of Michael Johnson, was born at Leicestet, on 18th September 1709. He received his early education in his native town, from a man named Hunter; of whom he has recorded that 'he beat me very well—adding, 'without that I should have done nothing.' In 1728, he went to Pembroke Hall, Cambridge. Friendly to him and his pupils were many persons of note, and thus far he had no pecuniary means. A little after he was admitted to the B.A. in 1730, his father, who was a solicitor, allowed him to go to London, and with the assistance of a friend, he entered upon a career of bookselling. The Short Account of Leicestet, 1819, says that books of his binding are still extant in that city. At Oxford, J. spent probably the most prosperous part of his professional life. Overpowered by debts, difficulties, and religious doubts, he became a prey to the morbid melancholy of his constitution. Poverty prevented him from taking his degree. In 1731, his father died; and in the same year he went to Bosworth as usher of a school. Finding the drudgery of this situation unendurable, he soon gave it up, gaining a meagre livelihood by working for booksellers in Birmingham. In 1736, he married Mrs Porter, a widow: she brought him money. He then set ageing a school, which having no success, he repaired (1737) to London in the company of his celebrated pupil, David Garrick. Here he formed a connection with Cave, the editor of the Gentleman's Magazine, to which he periodically contributed. In the following year he published London, a poem in imitation of the Third Satire of Juvenal, which was very favourably received, Pope, in particular, being warm in its praise. But for ten years he was miserably remunerated for his work, and had great difficulty in keeping the wolf from the door. Little is known respecting J.'s life from this period till he was turned of fifty. We may form an idea of the general course of his life from the following extract from his Journal, written by himself, after he had ascertainment the order in which the different speakers rose, and the drift of their arguments. One can readily believe that statesmen were surprised at the splendour and pomp of their own eloquence when they saw it in his pages. In 1744, his publish'd his interesting Life of Richard Savage; in 1749, his best poem, The Vanity of Human Wishes, an imitation of the Tenth Satire of Juvenal; and in 1750 commenced The Rambler, a periodical which he conducted for two years, and the contents of which were almost wholly his own composition. His Dictionary, a noble piece of work, entitling itself the author to being considered the founder of English lexicography, appeared in 1755, after eight years of toil. The Idler, another periodical, was begun by J. in 1758, and carried on for two years also; and in 1759 occurred one of the most touching episodes of his life—the writing of Rasselas to pay the expenses of his mother's funeral. In this last written, he tells us, 'in the evenings of a week.' At last he emerged from obscurity. In 1762, a
JOHNSTON—JOINT AND SEVERAL.

Pension of £300 a year was conferred on him by Lord Bute; and in the following year occurred an event, apparently of little moment, but which has had a lasting influence upon his fame; this was his introduction to James Boswell, whose Life of Dr Johnston is probably more imperishable than any of the doctor’s own writings. In 1764, the famous Literary Club was instituted, and the following year began his intimacy with the Threates. In the same year appeared his edition of Shakespeare. In 1773, he visited the Highlands with Boswell. In 1781, appeared his Lives of the Poets, his last literary work. He died on 28th December 1784. He was buried in Westminster Abbey, close by the grave of Garrick.

Strength, or at least force of mind, a certain sage solemnity in the treatment of moral themes, a sharp eye for the observation of character as it manifests itself in society, and a great power of caustic wit, are the chief qualities noticeable in Johnson. He had a delicate aptitude for abstract thinking, and no great vigour of imagination—hence he was neither a philosopher nor a poet; but he had good sense, a solid judgment, and a serious thoughtful nature—hence we find scattered through his numerous works, a multitude of valuable remarks on books and men and manners. His writings are not very numerous, inspired by the poet, or the critic, the language is frequently grander than the thought, but his conversational style, as reported by Boswell, is terse, robust, and felicitous in the highest degree.

JOHNSTON, Alexander Keith, the most distinguished name in British cartography, was born near Edinburgh, on December 29, 1706. The elegance of design that characterises all his productions, and which, in spite of their purely utilitarian aim, gives them a right to rank as specimens of fine art, was probably acquired or developed during his apprenticeship as an engraver. His first important work, the National Atlas (fol.), was published in 1743. Its merits received immediate recognition, and J. was appointed Royal Geographer for Scotland. Five years later, appeared his famous Physical Atlas of Natural Phenomena, the publication of which was the signal for a shower of honours from the geographical societies of Europe—that of Paris, in particular, pronouncing the work ‘one of the most magnificent productions that has yet been raised to the scientific genius of our age.’

A second edition, greatly improved, was issued in 1786. In 1790, appeared a very useful Dictionary of Geography, better known as “Johnston’s Gazetteer” (51 ed. 1859; 4th ed. in course of preparation). His last and greatest work, the Royal Atlas of Geography (Edin. Blackwood and Sons, 1861), is probably the most beautiful and minutely accurate atlas ever executed. J. has also published, in conjunction with other savants, Hind, Murchison, and Ncid, atlases of Astronomy and Geology; besides a great number of very valuable educational atlases, physical, general, and classical, which have obtained a wide circulation.

JOHNSTONE, a manufacturing town of Scotland, in the county of Renfrew, was founded in 1781, and is situated on the Black Cart, about three miles west-south-west of Paisley. It contains several cotton factories, brass and iron foundries, and machine-shops. Pop. (1861) 6404, one-third of whom are employed in the cotton manufacture.

JOHNSTON, James T. W., an eminent chemist, was born at Paisley in 1796, and died at Durham in 1853. He was of humble parentage, and for the most part self-educated. In 1825, he removed to Durham, where he opened a school, which he continued till 1839, when, having married a lady of considerable fortune, he resolved to carry out the plan which he had long desired, of devoting himself to the study of chemistry. He accordingly repaired to Stockholm, and became the pupil of Berzelius, the most celebrated chemist of the time; and his reputation rose so rapidly, that in 1833, while still pursuing his studies abroad, he was invited to take the readership in chemistry and mineralogy in the new university of Durham. Its foundation had been decreed some time after his return from the continent, he resided in Edinburgh, and held the post of chemist to the Agricultural Society; but shortly after its dissolution was appointed to the chair in Durham. It is as an agricultural chemist that he is chiefly known. His Catechism of Agricultural Chemistry and Geology has gone through more than fifty editions, and has been translated into almost every European language; and his Lectures on Agricultural Chemistry and Geology are held in high esteem. The last of his works was his Chemistry of Common Life, which originally appeared in Blackwood’s Magazine, and has since gone through two editions. In the summer of 1853, while travelling on the continent, apparently in his usual health, he was seized with spitting of blood, which terminated in a rapid decline.

JOINERY, the art of joining or framing together the wooden finishings of buildings, such as the doors, windows, shutters, stairs, &c. See Carpentry.

JOINT AND SEVERAL, a legal phrase in England and Ireland, meaning that a contract or obligation is to be by, or in favour of, several parties, independently as well as jointly with the others. The general rule of law is, that a contract of several persons is joint, and not several—that is to say, if it is sought to be enforced against them, they must all be sued together, and an action cannot be brought against one. Thus, for example, if A, B, and C jointly accept a bill, or make a promissory-note, without saying, ‘we jointly and severally promise, &c.,’ the whole of them must be sued at the same trial. If, however, the parties have incurred the whole debt, can sue his co-creditors for their respective contribution or proportion—namely, one-third from each. If, on the other hand, the parties have incurred the whole debt, can sue his co-creditors for their respective contribution or proportion—namely, one-third from each. If, on the other hand, the parties have incurred the whole debt, can sue his co-debtors to contribute their fair proportions. So, if a contract is made in favour of two or more persons, the general rule is, that all of them must join in any action brought to enforce the contract. But in some cases, when a contract is capable of being separated into distinct interests, it is not necessary that all of the creditors should sue. Much depends on the nature of the contract, the situation and relations of the parties, and who paid the price or consideration. In Scotland, the phrase joint and several, is more frequently used than jointly and severally, though the meaning is the same. There are, however, some differences between the laws of England and Scotland on the subject. In Scotland, the general rule is the reverse of what it is in England. When a contract is joint, each is concerned and liable only for his share; but when it is expressly stated to be a conjunct contract, each is liable for the whole. Moreover, whereas one of several debtors is discharged without an express reservation of remedy against
the rest, this operates in England as a discharge to the whole; whereas in Scotland it operates only as a discharge of that one.

JOINT-FIR. SeeSEA-GRAPE.

JOINT OWNER is, in English Law, a person who is one of several owners of property. The property may be either personal or real, goods or land. One of the characteristics of the ownership is, that if one of the parties dies, his interest accrues to the others, and does not go to the deceased co-owner's heirs or representatives. Thus, if A and B are joint owners of a horse, and A dies, the horse then belongs entirely to B. So, if it is with real property, such as houses, lands, and estates. This is called the doctrine of survivorship. Sometimes in wills and deeds it is not clearly expressed whether the property was given to A and B, or to joint tenants or owners, or as tenants in common.

The chief difference between these two descriptions of owners is, that if one tenant in common dies, his share does not go to the other tenants in common, but belongs to his representatives and not to his heirs. Hence, in doubtful cases, a court of equity generally inclines to hold that a tenancy in common was meant rather than a joint tenancy, for the former is the more fair of the two kinds of ownership. In all cases, however, it is in the power of a joint owner to convert his joint tenancy into a tenancy in common, by simply executing a deed of partition or alienation, if the property consist of land; or selling his share, if it consist of personally. And there is no exception as to the right of the survivor in the case of a firm of partners, for in that case, when one partner dies, his share does not accrue to his co-partners, but belongs to his own personal representatives. This is said to be an exception to the general doctrine, and is intended only for the benefit of trade, so that, in the case of a firm, the ownership is an ownership in common, and not joint ownership. In Scotland, the general rule is different from what prevails in England, and in joint property there always equivalent to what is called in England property held in common, and not joint in the above sense. It requires express words in Scotland to make the property be held so as to be equivalent to what is joint-equivalent property in England.

JOINT-STOCK COMPANY, an association of individuals who unite to carry on a particular object of a private nature by each taking and paying for shares in the common stock. The object of the association may be to manufacture some species of article, to conduct some branch of trade or commerce, the business of banking or insurance, or in general to do whatever work of a private nature any individual can do; but when the object is to execute a public undertaking, such as a railway, a canal, harbour, or other work of importance, the company is not called a joint-stock company, but a public company, and a special act of parliament is required in order to establish it and regulate its proceedings. In many respects, the proceedings of railway, canal, and public companies resemble those of what are called joint-stock companies. In ordinary circumstances, the capital or stock of a joint-stock company is beyond what any single individual, however wealthy, would be able or inclined to adventure; it is mainly on this account that the joining of parties together to undertake risks is expedient and unavoidable; though there may be instances, as in the case of Co-operation (q.v.), where a union of small sums by a large number of persons is for peculiar reasons commendable. Joint-stock companies are of comparatively modern origin, and they can exist with a chance of success only in a community possessing good business notions and habits, along with a spirit of enterprise, and where there is that degree of mutual confidence which will give stability to the concern. Accordingly, from a concurrence of favourable circumstances, Great Britain has taken the lead in this kind of undertakings. The Dutch, however, have also been carried to maturity on a comprehensive plan in the Netherlands and United States. In France, this method of commercial association is of more recent growth, and appears still to require the fostering care of the state.

The usual process of commencing a joint-stock company is to issue a prospectus, detailing the object of the undertaking, inviting the subscription of shares, and specifying the probable profits. As the prospectus was given to A and B, joint tenants or owners, or as tenants in common.

Every joint-stock company sets out on certain rules of management, which receive the approval of the shareholders, and, when a certain number of shares are subscribed for, a board of directors, and these, on being appointed, choose subordinate officials. Whatever be the rules, and also the implied responsibilities, the practice is to allow considerable latitude to the chairman and other directors in conducting the affairs of the company, for they alone are in a position to form a correct judgment on points deeply concerning the character and welfare of the association. As, with the best intentions, they may fall into error, and thereby incur heavy losses of capital, it is reasonable to hold them blameless, unless chargeable with fraud in their representations and general dealings. Ordinarily, and with reckless imprudence, shareholders ask no questions, and experience no suspicions as long as they are getting satisfactory dividends—a indifference to consequences which sometimes suffers a severe retribution.

Joint-stock companies are at least a clumsy and often not very satisfactory method of financing a particular enterprise. Conducted by directors or managers with whatever dexterity, they fall immeasurably behind as regards the energy, breadth of calculation, vigilance, and promptitude with which a business may be conducted by a single individual, or by two or three active partners, ready on the instant to take advantage of every important turn in the market. Unless, therefore, in the exceptional circumstances referred to, and also in gigantic concerns which no single individual or ordinary copartner would undertake, joint-stock companies are economically inexpedient.

The legislature has on different occasions interposed to regulate the principles of joint-stock companies, and to protect the public against the injuries which they may recklessly inflict. The safest undertakings are those of a public nature, and which are therefore incorporated by special act of parliament, for besides that their rules have been scrutinised by both committees of the Commons and Lords in terms of certain standing orders, the liability of shareholders is limited expressly to the amount of their respective stocks. Railway companies are of this category. Where there is no such limitation by statute, any single shareholder incurs a responsibility equal to the whole debts of the concern, and he can seek relief only against his brother shareholders conjointly or severally. The
awful nature of this responsibility, and the necessity for as far as possible averting it, have induced the legislature to empower the organisation of companies on a method of limited responsibility: in this respect copying a plan which had worked successfully in the United States. To participate in the benefit of this limitation, companies need to be publicly registered according to certain statutory obligations, by which means all have an opportunity of their characters being published. We add a brief analysis of the laws affecting joint-stock companies without and with limited liability.

Numerous statutes have been passed during the last 20 years in England, Scotland, and Ireland, to regulate the constitution and proceedings of joint-stock companies, and there were separate statutes for each kingdom, and also for different kinds of companies in each kingdom. The principle of limited liability is embodied in the separate statutes, which led to much confusion, have now been repealed, and replaced by one consolidated statute, called the Companies' Act, 1862, 25 and 26 Vict. c. 98, which, taken along with the common law, is the basis of the law of joint-stock companies now applicable to the United Kingdom. This general act contains provisions for enabling existing companies previously registered to register themselves under the new act. The same formalities are made applicable, with slight variations, to all joint-stock companies, whether limited or unlimited. The grand distinction between limited and unlimited companies is, that whereas formerly, if a company contracted debts, no matter how large, every member of the company had to pay their proportion, to pay the whole of those debts, even to the last shilling of his fortune—a result which proved ruinous to the richer members: now, on the other hand, if the company is limited, though it may be unable to pay its co-members must be able to pay their proportions, to pay the whole of those debts beyond what the members are bound to pay, it is the creditors alone who will chiefly suffer; but they have such ample means of satisfying themselves beforehand about the position and capabilities of the company, by means of the publicity and access to books now provided, that they can only blame themselves if they credulously give too large credit.

It may be also noticed, before stating the details more particularly, that no partnership of bankers which consists of more than ten persons shall be formed in future unless it is registered and conducts its business under the Companies' Act, 1862; and other partnerships consisting of more than twenty persons, are in like manner compelled to register as a company, unless they are already registered, or are formed by some act of parliament or letters-patent. The subject will be most conveniently noticed under certain heads.

1. Constitution and Incorporation of Companies and Associations.—Any seven or more persons associated for any lawful purpose may subscribe a memorandum of association, and may define their liability as limited or unlimited, they may limit their liability either with respect to the amount, if any, unpaid on their shares, or to such amount as they may respectively undertake to contribute to the assets of the company, in the event of its being wound up. If the liability is limited by shares, then the word 'limited' must be added to the name of the company; and the amount of capital, object, place of business, and declaration of the limit, must be defined in the memorandum of association. If the liability is limited by guarantee, the word 'limited' must also be added, and the amount of guarantee defined, so as to extend to all liabilities incurred while the party is a member, and within one year after. If the company is formed on the principle of no limit being placed on the liability of its members, the declaration of any limit is omitted, and it is called an unlimited company. The memorandum of association is to be stamped and signed by each subscriber in presence of one witness, and these are to sign the certificate when the company is formed.

A company in general cannot alter this memorandum of association, unless where it is a company limited by shares, and wishes to increase its capital or shares. Nor can a company alter even its name, unless by special resolution of the company, &c. A list is to be made out of all members, with the names, addresses, and occupations of each, as well as the amount of capital, shares, calls, &c., possessed and paid by each, and an extract of this register is to be furnished to the registrar of joint-stock companies for inspection. Every member is entitled to inspect at the office of the company the register of members gratis, and any other person is also entitled to do so on payment of 1., or such member or person may demand a copy on payment of 6d. for every 100 words. The name of a person is without cause entered or omitted in the register, he can set the matter right by application to the court. When a company is wound up, every member must and is bound to contribute towards the assets enough to pay the debts of the company, subject to the following qualifications:

1. No past member shall be liable who has ceased for one year to be member; 2. No past member is liable to contribute to any debt contracted after he ceased to be member; 3. No past member shall be liable to contribute, unless the existing members are unable to pay the debts; 4. In case of a limited company, no member bound to pay more than the amount unpaid on shares, or the amount guaranteed by him to be paid, according to the memorandum of association. In insurance companies, if the policy or contract makes the funds alone liable, such contract shall not be binding on the person. If a member dies due to a member, this is to be deemed part payment of his contribution. The result, therefore, is, that in all unlimited companies, while one rich member may be liable to his last shilling to pay the whole debts of the company, in the event of his co-members not being able to bear their shares of these debts; in limited companies, each member can never be liable to pay more than the maximum share or guarantee, whatever be the amount of the
company's debts, and whether the other members pay their shares or not.

   - Each company must have an office where its business is carried on, and give notice thereof to the registrar. If the company is limited, it must have its name painted up in a conspicuous place outside its office, and its name must, under a penalty, be printed or engraved on all its notices, advertisements, bills of exchange, cheques, receipts, and the like. Every limited company must also keep a register of mortgages affecting its property, which any member or creditor is entitled to inspect at all reasonable times. Some companies—viz., limited banking, insurance, one-fifth or more of the members, must also each year make out and suspend in their offices a statement of their debts and assets. Every company not having a capital divided into shares, must keep at its office a register of its directors and managers. No company is to carry on business when the number of members is less than seven, otherwise each such member, if cognizant of the fact, shall be liable for the whole debts of the company. A general meeting of the company must be held once a year, at which the company may in general meeting alter its regulations by special resolution, passed by not less than three-fourths of the members, and a copy thereof must be sent to the registrar, and given to each member. The Board of Trade may appoint one or more inspectors to examine the accounts and report on the affairs of the company on the following application: 1. in case of a banking company having a capital divided into shares, on the application of members holding one-fifth or more of the shares; 2. in the case of any other company with shares, on the application of members holding one-fifth or more of the shares; 3. in the case of any company not having a capital divided into shares, on the application of creditors of the company. The reasons of the application must, however, be supported by satisfactory evidence. The expenses of such examination shall fall on the members requiring it, unless the Board of Trade order them to be paid out of the company's funds. The company itself may also by special resolution appoint inspectors to report on the company's affairs.

4. Winding up of Companies.—A company may be wound up whenever it passes a special resolution to that effect; also whenever the company ceases its business within a year after incorporation, or suspends its business for a whole year; also, whenever its members are reduced to less than seven; also, whenever it is unable to pay its debts; and lastly, whenever the court thinks it just and equitable that it should be wound up. A company is in the above sense deemed to be unable to pay its debts whenever a creditor to whom the company owes a debt above £50 has formally demanded in writing payment of such debt, and the company for three weeks have neglected to pay, or secure, or compound for it. Other tests of being unable to pay its debts are, when the company allows execution to issue for a debt, &c. Application may be made to wind up the company by petition presented by any creditor or contributory of the company. And whenever an order is made by the court for winding up, all actions and suits are to be stayed, and the remedy of usury is to be heard by the registrar. In the process of winding up, the court is to have regard to the wishes of the creditors or contributories. In order to conduct the proceedings in winding up, and to assist the court, official liquidators may be appointed by such court, and the liquidators are then invested with full powers to bring and defend actions, sell property, and do all things necessary for winding up the company's affairs, and may appoint a solicitor to assist in performing these duties. The court, also, after an order to wind up, settles a list of contributories, i.e., of all persons who are bound to contribute to pay the debts of the company, also makes calls on such contributories, and may summon suspected persons who have property of the company. Besides a compulsory winding up of a company, there is also a power of voluntary winding up, whenever a special resolution has been passed to that effect, or when the company has found its liabilities too great to allow it to go on. Liquidators are then appointed with the same powers as in the other case. There is also a third mode of winding up, which is called the winding up subject to the supervision of the court. The liquidators have power to compromise calls and liabilities to calls, as well as debts present or future, upon such terms as may be reasonable. And where directors have misapplied moneys, or been guilty of breach of trust, the court, notwithstanding he is criminally responsible, may compel him to repay moneys so misapplied. The court may also order directors or officers of the company to be prosecuted, and the costs to be paid out of the assets. In Joint-stock companies, the appointment of registrars of joint-stock companies is made by the Board of Trade, and there must be at least one office for registration in each of the three kingdoms. Every person is entitled to inspect the documents kept by the registrar on paying a fee not exceeding one shilling, and he may require a copy or extract of documents at a fee not exceeding sixpence for each folio.

Moreover, as regards other remedies, it is now a criminal offence for directors of companies to declare and publish fraudulent accounts; and not only are directors personally liable to third parties buying shares on the faith of such false reports, and suffering losses, but even the officials whose duties contribute to these false reports, are also personally liable in damages.

JOINT TENANCY, in English Law, the ownership of land or goods along with one or more other persons. See Joint Ownership.

JOINT TRADE, or ADVENTURE, means a partnership limited as to a particular undertaking, and not, as in the usual case, for a series of years or a definite period of time. Hence the parties joining have not the same liabilities as ordinary partners of a firm. Thus, a partnership may be limited to the working of a patent. In all such cases, the rights and liabilities of the parties are much less extensive than those of ordinary partnerships; but everything depends on the particulars of the contract made between them.

JOINTRESS, in English Law, means a lady who has a Jointure (q. v.) secured to her.

JOINTS, in Anatomy. A joint or articulation may be defined to be the union of any two segments of the skeleton of an animal body, through the intervention of a structure or structures of a different nature. The fleshy textures which enter into the formation of the more complex joints are bone, cartilage, fibro-cartilage, ligaments, and synovial membrane. Bone forms the fundamental part of all joints; ligament, in various modifications, is employed as the bond of union between the body segments; while the remaining textures chiefly occur in those joints in which there is free motion. The joints vary in the degree of motion from almost perfect immobility to the greatest amount and extent of motion that are compatible with the maintenance of the bony segments in their proper relation with each other. Joints have been divided by anatomists into two great classes, to which the terms Synarthroses and
JOINTS.

Diarthroses are applied. In synarthroses, the parts are continuous—that is to say, there is no synovial sac intervening between the bones; and the joints belonging to this class are so very limited in their motion as to be considered by some as immovable; while in diarthrosis, the articular surface of each of the bones is covered with cartilage, and between these cartilaginous plates is a synovial sac; and mobility is the distinguishing feature of this class of joints. In briefly describing the leading varieties of these two classes of joints, we shall, as far as possible, avoid the barbarous terms which have been introduced into this department of anatomy.

In diarthrosis, the articulation is said to be by suture when the bones seem to grow somewhat into one another, and to become interlocked and dovetailed together, each bone having a jagged or serrated margin, or when there is a degree of bevelling of one bone, so that it is overlapped by the other. Both these kinds of suture are at once seen in the human skull, the serrated suture being well seen in the union of the two parietal bones, the bevelled suture being shewn in the overlapping of the temporal bones above the sides of the parietal, and a combination of the two being exhibited by the coronal suture between the frontal bone and the anterior edges of the parietal bones. In all these there is a combination of ligamentous membrane interposed between the bones, which disappears as the growth of the cranium becomes completed.

When a slight amount of motion of one bone upon another is required to be combined with great strength, the contiguous surfaces of the bones are united by a thick and strong layer of fibro-cartilage, with which a little elastic tissue is intermixed. This is an intermediate variety between the two classes of joints, but approximates most nearly to the motion of the first kind of joint. The importance of the second variety of joints may be mentioned the articulation between the bodies of the vertebrae and that between the two pubic bones at what is termed the symphysis. See FELVIS.

In diarthrosis, the degree and nature of the motion are very various. There may be merely a little gliding motion between the ends of the bones, as, for example, in the articulations between the various bones of the carpus and tarsus. See HAND and FOOT. In other cases, the surfaces are curved, and the motion is limited by the ligaments of the joint or by some projecting point of one or both bones. In some cases, instead of a slight concavity and convexity, one bone presents a cup-like depression, while the termination of the other assumes a hemispherical, or more or less globular shape. Hence the name of ballot and socket that is applied to such joints. The best example of this variety is the Hip-joint (q. v.), and the next best is the shoulder. In these joints, the ball is kept in apposition with the socket by means of what is termed a capsular ligament, which may be described as a barrel-shaped expansion of the ligamentous structure, attached by its extremities around the margin of the articular surfaces composing the joint, and forming a complete investment of it, but not so tight as materially to restrict its movements. In this species of joint, the muscles of all kinds, as any one may readily test for himself, especially in the shoulder-joint.

Another important variety of articulation is the hinge-joint, in which the contiguous surfaces are marked with elevations and depressions, which exactly fit into each other, so as to restrict motion to one direction. The elbow and ankle joints, and the joints of the fingers and toes, are the best examples of this variety. The knee-joint is a less perfect example, because in certain positions it is capable of a slight rotation. These hinge-joints are always provided with strong lateral ligaments. The shells of bivalve molluscs are united by a very strong and perfect hinge-joint.

The last kind of joint requiring notice is that which admits only of rotatory motion. A pivot and a ring are the essential parts of this joint, the ring being generally formed partly of bone and partly of ligament. The best example of this articulation is that between the atlas (the first vertebra) and the odontoid or tooth-like process of the axis (the second vertebra). See HAX.

Directions of the Joints.—Formerly, all the severer forms of diseases of the joints were vaguely designated under the one general term white swelling; but during the last half century, thanks to the labours of modern surgeons, amongst whom the name of DITAM is prominent, the diseases are becoming well understood, and can be discerned from each other, and in many cases successfully treated.

In diseases of the joints, we may have one or more of the following textures affected: (1), the synovial membrane; (2), the cartilage; and (3), the bones themselves.

Diarthrosis may undergo either acute or chronic inflammation, giving rise to the serious affections known as acute and chronic synovitis (q. v.).

Loose substances of a fibrous structure, and usually resembling a small bean in size and shape, sometimes occur in joints, especially in the knee-joint. They commence as little pendulous growths upon the synovial membrane, which after a time become detached. When they get between the ends of the bones, which they may do by disease, they cause severe local pain and a most exasperating pain, which is often followed by inflammation, and arrest all motion of the joint. These symptoms are not relieved, by gentle flexion and manipulation, the loose cartilage (as it is usually termed) having been removed to a position in which it is inoffensive. The displacement of the loose body is only occasional, and does not cause serious pain, the treatment should be limited to the application of a splint or slight bandage or a tightly fitting knee- or arm-stiffener, or one fixed upon the leg, or the view of restraining the loose body to a position in which it is inoffensive. If, however, this palliative treatment fails, the offending body must be removed by sub-cutaneous incision, which avoids the danger of a direct wound into the joint.

The cartilage may be affected in various ways. There may be (1) simple destruction of cartilage; (2), acrofulous destruction of cartilage; (3), hypertrophy of cartilage, or (4), atrophy of cartilage, and other modified forms of Disease. In all of which, especially the second, are, of a very serious character, but not of a nature that admires of popular explanation.

The most important diseases of the osseous structures of the joints are (1) ulcer and (2) caries. These diseases often, but not always, begin with the disorganisation of cartilage, and then extend to the bones. Sometimes, however, they commence in the bone. The general treatment and the general symptoms of these diseases would be out of place in these pages, but a reference to one very important mode of treating articular caries will be found in the article Resection of Joints. Several of the preceding diseases, even when the result of our treatment may be regarded as satisfactory, leave a certain amount of stiffness of the joint (sometimes extending to perfect immobility), to which the term Ankylosis (q. v.) is applied.
JOINTURE, in English Law, means an estate or some interest for life or a longer period in an estate settled upon a wife, in the event of her surviving her husband. The jointure was at first adopted as a substitute for Dower (q. v.), and dower is barred if a jointure is provided. The requisites of a jointure are: 1. That it must commence and take effect immediately on the husband's death; 2. It must be for the wife's life, or for some greater estate; 3. It must be given to the wife herself, and not merely to trustees for her; 4. It must be expressed to be made in satisfaction of her whole dower; 5. It must be made before marriage. The mode of giving a jointure is usually by way of a rent-charge on the husband's real estate, the effect of which is to allow her to remain in possession of the estate, or part of it, after the husband's death, so long as she lives. If a jointure be created out of an estate before marriage, the husband cannot sell the estate afterwards, so as to defeat the jointure. A jointure is not lost by the treason or felony of the husband, nor by the levemption and adultery of the wife.

In Scotland, the word jointure is also frequently used in a similar sense to denote a conventional provision to a widow, consisting either of an annuity to her or of a life rent of rents, or of a life of land, called a locality. In whatever way the jointure is constituted, it also excludes the widow's dower, unless it is otherwise expressed.

JOINVILLE, JEAN, SIEUR or SIE DE, one of the earliest French historians, whose works possess much interest or value, was born about 1224, of an old family, in Champagne, and held offices under Thibault IV., king of Navarre. In 1248, he joined Louis IX. of France with nine knights and 700 armed men in his crusade; shared that monarch's captivity; and returning to France in 1254, was frequently at his court, but declined to accompany him in his second crusade. After the death of Louis IX., the Sieur de J. wrote his Histoire de St Louis, one of the most valuable works in the whole literature of the middle ages, combining an elegance of style then very rare with a most interesting exhibition of individual character in the minute record of events. He died about the year 1318. The Histoire de St Louis was first published at Potters in 1548; the latest edition is that of F. Michel (Paris, 1858).

JOISTS, horizontal timbers (of lighter scantlings than the beams) used to support floors. See FLOORS.

JOLLY-BOAT. See NAGER.

JOLLY-BOAT (Dutch, jolle, a yawl), a small boat kept on board ship for the purpose of communicating with the shore. It is a broad, safe

military career in a Swiss regiment in the French service, and afterwards, chiefly through the friendship of Ney, was raised to high military rank by the Emperor Napoleon. In 1804, after the publication of his Traité des Grandes Opérations Militaires, he distinguished himself in active service during the retreat from Russia, but offended at the treatment which he received from Napoleon, he passed over to the allies after the armistice of Plessowitz, and entered the service of Russia. In 1828, he took an active part in the military operations at Varna; and in 1855 he settled at Brussels. Besides the work already mentioned, his Tableaux Critique et Militaire des Campagnes de la Révolution (5 vols. Paris, 1806), his Vie Politique et Militaire de Napoleon (4 vols. Par. 1827), and his Tableau Analytique des Principales Combinaisons de la Guerre (Petersh. 1839) are of great value to the military student.

JO'NAH (Heb. Yonah, a 'dove'; Gr. Jonas), a Hebrew prophet, son of Amittai, was, as we learn from 2 Kings xiv. 25, a native of Gath-hepher, a town of Galilee in Zebulun, and not far from Phoenicia. He appears to have flourished about the second half of the 8th c. B.C., in the reign of Jehoahaz, and was probably, therefore, the earliest of those prophets whose writings are extant. It has been urged by Rosenmüller and other critics, that the miracle recorded in the book known under his name is not to be regarded as an historical fact, but only as an allegory, founded on the Phoenician myth of Hercules rescuing Hesione from the sea-monster by leaping himself into its jaws, and for three days and three nights continuing to tear its entrails. The design of the author in incorporating this myth with the actual voyage of J., and the conversion of the heathen Ninevites, was, it is suggested, to bring out more vividly the truth, that God will not permit his merciful intentions to be frustrated by the disobedience even of a prophet. On the other hand, it has been thought by orthodox theologians generally, that the language of Christ (Matt. xii. 39-41; xvi. 4; Luke xi. 29), and the manner in which it is mentioned in Josephus and the Apocrypha, preclude the possibility of our supposing this miracle to be other than strictly historical. J. has been supposed by early authorities to have been the son of the widow of Sarephet (1 Kings xvi. 24), also to have been the pupil of Elisha. J.'s tomb is shewn at Neby-Yunus (Prophet Jonah), near Mosul. Leusden, Jonas Illustratus (Utrecht, 1692); Friedrachsen, Kritischer Ueberblick der Ansichten von Buxh Jonah (A1ton, 1817); Rosenmüller, Proleg. in Jonann; also Notes on the Prophecies of Jonah and Hosea, by the Rev. W. Drake (Cambridge, 1853).

JONES, IZIGO, a well-known English architect, was born in London in 1572. Of his early history, little is known till the time when the Earl of Pembroke, attracted by his great aptitude at drawing, sent him abroad for four years to study the master-pieces of architecture in France, Germany, and Italy. While in Venice, he paid particular attention to the works of Palladio, whose style he introduced into England, whence we sometimes hear J. designated as the English 'Palladio.' In 1605, he was employed by James I. in arranging the scenery, &c., for the masques of Ben Jonson, which were at that time the chief amusement of Court. Jonson afterwards satirised his fellow-labourer in Bartholomew Fair. In 1612, J. revisited Italy, still further to improve his style, and on his return to England was appointed surveyor-general of the royal buildings at Wren's advice. He was the first architect of England, and according to some,
the first of the age. He died in 1653. The state of architecture in England during J. s time was an excellent foil to his genius, as the praise bestowed upon his works shows; and in any age he would have ranked high as an architect. His master-piece is considered to be the Banqueting House at Whitehall. Other works of his are the church of St Paul, in Covent Garden, Ashburnham House, and Surgeon's Hall, which, however, are very mediocire.

JONES, John Paul, born at Arbigland, in the shire of Kirkcudbright, Scotland, 6th July 1747, was the son of a gardener named John Paul. He became a sailor, was for a short time engaged in the slave trade, and afterwards settled in Virginia, assuming the name of Jones. He ardently embraced the cause of the American colonies. When the Congress, in 1775, resolved to fit out a naval force, he offered his services; and visiting the British coast in a brig of 18 guns, performed some remarkably bold exploits, and took advantage of his familiarity with the scenes of his boyhood to make a hostile visit to the shores of the Solway Firth. In 1779, he was appointed to the command of a small squadron of French ships displaying the American ensign, with which he soon visited the British coasts, causing great alarm, and taking some prizes. The King of France made him a chevalier of the order of Military Merit. After the war was ended, J. attempted, along with John Leslyard, to establish a fur-trade between the north-west coast of America and China, but failed. In 1787, he accepted an appointment in the Russian service, and the command of a fleet at the mouth of the Dnieper, with which he took an active part in the Turkish war, but soon left the Russian service. He died at Paris, 18th July 1792. His funeral was attended by a deputation of the Legislative Assembly.

JONES, Sir William, was born in London, 28th September 1746, and was sent to Harrow in 1753, where he soon eclipsed all his fellows, particularly in classical knowledge. In 1764, he was entered at University College, Oxford, where he was enabled to gratify that desire for a knowledge of the oriental languages which had shewn itself during the last two years of his residence at Harrow. In 1765 he left Oxford, to become tutor to the eldest son of Earl Spencer, with whom he remained five years. In 1770 he published, at the request of the king of Denmark, a Life of Nadir Shah, translated into Persian from the Persian; in the following year, a Persian Grammar, re-published some years ago, with corrections and additions, by the late Professor Lee; and in 1774, his Commentaries on Asiatic Poetry, re-published by Eichhorn at Leipzig, in 1775. In 1780, he completed a translation of seven Arabic poems, known as the Moullakat, which obtain their collective name from being 'suspended' in the temple at Mecca; wrote an Essay on The Legal Mode of Suppressing Riots, and another, entitled Essay on the Law of Ballotings, and two or three odes. In March 1783, J. obtained a judge-ship in the Supreme Court of Judicature in Bengal, and sailed at Calcutta in September. He at once set about acquiring and improving of the knowledge of oriental languages, literature, and customs. He established the Royal Asiatic Society, for investigating the history, antiquities, arts, sciences, and literature of Asia, of which he was the first president; and the volume of the Asiatic Researches, Sir William contributed largely. Besides these, he wrote and published a story in verse, called The Enchanted Fruit, or the Hindu Wife; and a translation of an ancient Indian drama, called Sosontola, or the Fatal Bower. A translation by him of the Ordinances of Menu (q. v.) appeared in 1794. He was busily employed on a digest of the Hindu and Mohammedan laws, when he was attacked with an inflammation of the lungs which terminated fatally on the 27th April 1794. J. was one of the first linguists and oriental scholars that this country has produced. The East India Company erected a monument to his memory in St Paul's Cathedral, and a statue in the same building. The complete edition of his works, in 6 vols. 4to, was published by Lady Jones in 1799; and another appeared, in 13 vols. 8vo, in 1807, with a life of the author by Lord Teignmouth.

JONESIA, a genus of trees of the natural order Leguminosae, sub-order Ceraulipinaceae, having a two-leaved calyx, a funnel-shaped 4-lobed corolla, seven stamens attached to a ring which springs from the tube of the corolla, a scimitar-shaped pod. The leaves are abruptly pinnate. The Asoca of Sanscrit poetry (J. Acea) is one of the loveliest trees of the East. Its orange and crimson flowers grow in graceful racemes. Indian poetry abounds in its praises.

JONKÖPING, a town of Sweden, and one of the most beautiful and finely situated in the country, is capital of the len of the same name, and at the mouth of the southern extension of Lake Vätter, and is backed on the south and west by pine-clad hills. It is a maritime and trading town, and contains an arsenal and a factory for arms. Pop. 6604.

JONQUIL (F. jonquille, from Lat. jonca, a rush), a name given to certain species of Narcissus (q. v.) with rush-like leaves. The Common J. (N. Jonquilla), a native of the south of Europe, is one of the most common bulbous-rooted plants in our flower-gardens. It has from two to five flowers at the summit of its scape (leafless stem). The Sweet-scented J. (N. odoratus), also a native of the south of Europe, is another species very generally cultivated. Perfumed waters are made from J. flowers.

JONSON, Ben, or Benjamin, an English dramatist, was born, according to the most reliable accounts, at Westminster, though one authority says Warwickshire, in 1574. The Scottish poet Dunlop of Hawthornestates that J. told him his grandfather was a Scotchman of Annandale, who settled in Carlisle, and his father a clergyman, who died before Ben was born. The latter received his education at Westminster school, where he had for a time the ill-fated misfortune of being the flower that blossomed on the lode of his career from this point until the period when he became famous as an author is very obscure. It is said that his mother took a second husband, a bricklayer (but this is doubtful), and that Ben was forced very unwillingly to assist his stepfather. The story of his residence (for a few months) at St John's College, Cambridge, may be an authentic tradition, but it really rests on no better evidence than the present of some books now in the library of that college with his name inscribed on them. If he went thither at all, he was soon forced to return home for want of means; but his antipathy to the trade of a bricklayer was so great, that he finally ran off and served as a soldier in the Low Countries for some time. After coming back to England, he tried the profession of an actor, but did not succeed, whereupon he started as a writer for the stage. Even in this capacity he did not rapidly acquire a reputation. The first play that procured him a name was Every Man in his Humour (1598). The best of his subsequent productions are Volpone, or the Fox (1605), The Silent Woman (1609), and The Alchemist (1610). These are composed full of rich, dry, carefully-elaborated 'humour'. He
JOHAN.-JORULLO.

also composed two tragedies, Sejjeusa (1683) and
Culina, and a prose collection of several tracts on the
right but every-
thing, to have been written for the courts of James and Charles, are occasionally
very graceful. For many years J. was in receipt of a pension from these monarchs, but his careless and
prudent habits involved him constantly in difficulties,
and he died in poverty 6th August 1637. J.'s
writings are not much relished now, and never were,
even in his own day. There is an air of pedantry
about his happiest efforts that spoils their effect.
Yet, on the other hand, he had an eloquent style in
verse, and a humour which, if heavy and satiric, is
also genuine and pungent. Occasionally, too, his
lyrics shew a lightness and delicacy almost inex-
plainable, considering the ordinarily and cumbrous
movement of his faculties. The influence which he
exercised over the wits of his time is a proof of
the general strength and talent of the man. Shakess
ample alone reckoned his match in those wit-combats
held at the Mermaid Tavern. He was an immense
drinker, and his pettusions do not seem to have
improved either his temper or his constitution.
The best edition of his works is that by Gifford,
accompanied by a biographical memoir (Lond. 9
volu-
mes 1825-37; the latest is that by Barratt Smith,
published by Moxon (Lond. 1838; 34 ed. 1853).
JOEL, the name given in the Greek of the New Testament to a town called Iwio; in Hebrew Yafut; modern, Yafa or Joppa, i.e. beauty. It is situated
on the sea-coast of Syria, about 33 miles north
west of Jerusalem, and belonging to Samaria, is
also marked its name. J. is a place of great anti-
quity. Here, according to the classical myth, it
was that Andromeda was chained to the rock,
and exposed to the sea-monster, a story that has
been supposed to shadow out in an obscure way
the early intercourse between Greece and Syria.
In sacred history, it appears as the port of Jeru-
salem in the time of David and Solomon, and the
place to which the elders of Lebanon were floated
from Tyre for the building of the temple. It
was at J. that the Apostle Peter saw the vision
which corrected his Jewish prejudices concerning
the Gentiles and the spirit of Christianity. In
the reign of Constantine the Great, J. was
turned into a holy city, but in the times of the Crusades, when it became
the principal landing-place of the warriors of Christen-
wood. In 1719, it was stormed by the French under
Bonaparte, who even seemed to have been the hero of
many private
killings of Turkish prisoners. In 1822, Mohammed
Ali made himself master of it; but the Turks, with
the assistance of the British and Austrians, took it
from him again in 1840. The modern Jaffa is within
the pale of Gaza. Its wretched harbours is nearly
sanded up, and it has very little trade. Pop. about
5000.
JORDAN, Jakob, a celebrated Dutch painter,
was born at Antwerp in 1594, and died in 1678.
His works are exceedingly numerous, and are to
be found in most European collections. They
are marked by great truthfulness and vigour of por-
traiture, and are richly but rather garrulously
descended. Their chief defects are a want of taste and elegance in
design. Among his best known works are: the
"Merry-making," the "Satyr and Man blowing Cold and Hot," "Pan and Syrinx," and "Saturn devouring
his Children."
JORDAN, the principal river of Palestine, the
bed of which forms a great valley, stretching
from north to south in the eastern part of Syria. The
river, during its head-waters partly from the
eastern branches of the Lebanon Mountains, and
partly from Mount Hermon, flows south, and after
a course of 150 miles, having passed through the
small lake of Ed-Dahab (The Golden Lake) and the Lake of Tiberias (Sea of Galilee), it falls
into the northern extremity of the Dead Sea (q.v.). The bed of the river varies much in
breadth, and its banks are in some places flat,
and in others, steep. Where it enters the Dead Sea,
it is 180 yards broad, and 3 feet deep; but a
little way further up, it is only 80 yards wide,
and 7 feet deep. From the Lake of Tiberias
to the Dead Sea, the J. is crossed by no bridge,
or although in two places there are ruins of
bridges. Above the Lake of Tiberias is a bridge
called Jacob's Bridge, over which the road from
Damascus to the sea-coast passes. In a number of
places, the J. is fordable; in some, when the
river is in flood. The course of the J. was explored
by Lieutenant Molyneux, an English officer, in
August 1847, during the dry season; and by
Lieutenant Lynch, with an expedition sent out by
the United States' government in April 1848, when the
river was in flood. JORGENSEN, JORGENSEN, a Danish adventurer,
who, in the beginning of the present century, made
a descent on the island of Iceland, and reigned
there as protector for about six weeks, was the
son of a watchman in Copenhagen. He was
born in that city in 1779. On the 21st June 1809,
having previously visited the island in a ship in
which he held the position of interpreter, J. arrived
at Reykjavik in the Margaret Ann, an armed
vessel from London, carrying 100 men. A few days after, he surrounded the house of the
governor, took him prisoner, and informed the
people of his intention to hold Iceland in possess-
ion for England, 'until such time as the English
fleet should relieve him.' He then issued several
proclamations, announcing that relations with Great
Britain should be set on a firm footing, and Iceland
should be placed under her protection. He also organised a
government office, comprising all Danish property,
with whatever else he could lay hands on, to be
paid in gold, and subjecting the inhabitants to all
the miseries of an unscrupulous despotism. On the 9th
August, however, his brief reign was brought to a
close by the arrival of a British fleet, under
the command of which, bearing the flag of Her
immediately seized upon and imprisoned him,
restoring at the same time the previous condition of
affairs. J. was carried to England, but he does not
seem to have been visited by the punishment so
tfully merited. He afterwards lived in London for
some years, was convicted of robbery in 1820, and
transported to Botany Bay in 1825.
JORNADIES, or JORDANES, a historian of the
6th c., was by birth a Goth, or both of Alan and
Gothic descent. He was first a notary, but after-
wards adopted the Christian religion, and was made
Bishop of Croton, in Italy. He wrote two historical
works in the Latin language; the first, De Regum
et Successorum, is a brief history of
the most important events in history from the
creation down to 512 A.D.; but the work is only
valuable from the accounts in it of several barbarous
nations. In his other work, De Germanic
Origine et Relatibus Gestis (Concerning the Origin
and Deeds of the Goths), is a work which has obtained
great renown, chiefly from its being our only source
of information about the Goths and other barbarian
tribes, except when they are casually mentioned
by some Greek or Latin historian. The work is, how-
ever, full of inaccuracies, both of time, place, and
person. There are many editions of both works.
JORUL'LO, a volcanic mountain in the Mexican
Confederation, situated 150 miles west-south-west
720.
of the city of Mexico, was thrown up, in September 1759, to the height of 1375 feet from a plan, which itself was 2800 feet above the level of the sea; lat. 19° 10' N., long. 101° 2' W. This new creation originally consisted of a series of cones of various sizes. Many of the subordinate eminences have since disappeared altogether; some have changed their form; and few now emit vapour. The configuration of the surface has gradually declined, and much of the locality has been covered with forest trees.

JOSEPH I., Emperor of Germany, the eldest son of Leopold I., was born at Vienna 26th July 1718, was crowned king of Hungary in 1729, and king of Rome in 1730, became emperor in 1730, and died in 1771. The influence of the Prince of Salmo, who had the charge of his education, and his subsequent connection with Prince Eugene, led him to embrace opinions much more liberal than those which have generally prevailed in his family, and he granted privileges to the Protestants of Hungary and Bohemia, which had been refused by his predecessors. He also concluded a treaty in 1767 with Charles XII. of Sweden, by which he granted religious liberty to the Protestants of Silicia, and restored to them the estates which had been taken from them by the Elector of Hanover. He was fond of courtly ceremonial, but mild and affable, and sought to improve the condition of the peasantry in his dominions by relieving them from some of the oppressions to which they were subject. He eagerly and successfully prosecuted, in alliance with Britain, the war of the Spanish Succession against France.

JOSEPH II., Emperor of Germany, son of Francis I. and Maria Theresa (q. v.), was born 13th March 1741, at a time when his mother's fortunes were in their lowest state of depression. He early gave proof of excellent abilities. After the peace of Hubertsburg, he was elected king of Rome, and after the death of his father (18th August 1765), emperor of Germany. Maria Theresa also associated him with herself in the government of the Austrian states; but for some time his actual share in it amounted to little more than the chief command of the army. On her death in 1780, he inherited all her dignities and power. He was ambitious of increase of territory, and although he failed in his object of adding Bavaria to the Austrian dominions, which he thought to consolidate by obtaining it in exchange for the Low Countries, yet he was successful in the Galicia, Lodomeria, and the counties of Zips, at the first partition of Poland, in 1772; and he appropriated, in 1780, great part of the bishoprics of Passau and Salzburg. He was a zealous reformer, having imbibed, like Frederick the Great, the principles of the philosophy which prevailed in that age, but he attempted his reforms too rashly, and too much by the exercise of mere authority, and was compelled to restore many things again to their former condition; the hostility of the nobles and clergy, whose power and privileges he sought to reduce, producing rebellions in various parts of his dominions. The clergy in particular regarded him with detestation. He had early shown a dislike to them, which caused no little vexation to his mother; and as soon as he found himself in full possession of the government of Austria, he proceeded to declare himself independent of the pope, and to prohibit the publication of any new papal bulls in his dominions with effect. He prohibited the introduction of the bulls Unigenitus (q. v.) and In cond Domino (q. v.) was also prohibited. Besides this, he suppressed no fewer than 700 convents, reduced the number of the regular clergy from 63,000 to 27,000, prohibited papal dispensations as to marriage, and on 15th October 1781, published the celebrated Edict of Tolerance, by which he allowed the free exercise of their religion to the Protestants and Neunnted Greeks in his dominions. Pope Pius VI. declared this act of Messmer, the archbishop of Vienna, with the emperor, and for that purpose made a visit to Vienna in 1782; and although he was quite unsuccessful in his object, he carried away with him the conviction, that the people were utterly unpre pared for such reforms which their sovereign sought to accomplish, a conviction the correctness of which the event abundantly proved. J., engaged in a war with Turkey in 1788, in which he was successful; and the vexation caused by this, and by the revolts in his own dominions, and the necessity under which he felt himself of revoking many of the edicts by which he had sought to promote the welfare of his people, hastened his death, which took place on 29th February 1790. He founded many valuable institutions, and did much to promote the progress of arts, manufactures, and commerce in Austria.

JOSEPHINE, MARIE ROSE, Empress of the French, was born, 23d June 1763, in the isle of Martinique, where her father, Tacher de la Fage, had resided as a captain for 12 years. She was an indi den colonial education; but her qualities of mind and heart, even more than her beauty, won universal regard. When about 15 years of age, she was sent to Paris to be educated by her cousin, Alexandre Benjounais; of whom marriage was arranged, Engene, vicerey of Italy, and Hormese, queen of Holland, and mother of the Emperor Napoleon III. J.'s husband having been executed during the Reign of Terror, she herself just escaped through the events of 9th Thermidor (27th July 1794). She was married, 9th March 1796, to Napoleon Bonaparte, accompanied him in some of his campaigns, and exercised a great influence in restraining him from measures of violence and severity. At Malmaison, and afterwards at the Luxembourg and the Tuileries, she attracted round her the most brilliant society of France, and contributed not a little to the increase of her husband's power. She regarded his exaltation to the throne, however, with a presentiment of evil; and from the day of her becoming empress, seemed to dread that political motives might lend him to seek the dissolution of a union which had proved unfruitful in the eyes of the most painful kind, this took place. The marriage was dissolved by law on 16th December 1809. J. retained the title of empress, corresponded with Bonaparte, and if the allied sovereigns had permitted, would have rejoined him after his fall. She lived near Evreux, and died, after a short illness, on 29th May 1814. COMPAS Historie de l'Imperatrice Josephine (2 vols. Paris, 1850), by M. J. Aubenas.

JOSEPHUS, FLAVIUS, a colob brasted Jewish historian, was born at Jerusalem, 37 A.D. He was of high royal and sacerdotal lineage, being descended, on the mother's side, from the line of Asmonean princes, while his father, Matthias, capitulated as a priest in the first of the twenty-four courses. The careful education he received developed his brilliant faculties at an unusually early period, and his acquirements both in Hebrew and Greek literature—the two principal branches of his studies—soon drew public attention upon him. He was allowed to publish his first book, written in defense of the paramount religious schools of his time—the sects; at he inaccurately terms them—he withdrew it to the desert, to a man whom he calls Banus, and who is conjectured to have been either a follower of John the Baptist or an Essene. Three years later,
JOSHUA.—JOSIAH.

returned to Jerusalem, and henceforth belonged to the body of the 'Pharisees,' which, in fact, comprised the bulk of the people. So great was the regard for his character that, at his death, the hope of being tonsured there, he was chosen delegate to Nero. When the Jews rose in their last and fatal insurrection against the Romans, J. was appointed governor of Galilee. Here he displayed the greatest valor and prudence; but, in vain, he endeavored, and distributed among the tribes (67 A.D.) made resistance hopeless. The city of Jotapata, into which J. had thrown himself, was taken after a desperate resistance of 47 days. Along with some others, he concealed himself in a cavern, but his hiding-place was discovered, and being brought before Vespasian, he would have been sent to Nero, had he not—according to his own account, for J. is his own and his sole biographer—prophesied that his captor would yet become emperor of Rome. Nevertheless, he was kept in a sort of easy imprisonment for about three years. J. was present in the Roman army at the siege of Jerusalem by Titus; and after the fall of the city, he was introduced, as ambassador, to the court of some of his relatives. After this, he appears to have resided at Rome, and to have devoted himself to literary studies. The exact period of his death is not ascertained. All we know, is, that he survived his contemporary, Josephus, 20 years, and was married, and had children by his second and third wives.

His works are: History of the Jewish War, in 7 books, written both in Hebrew and Greek (the Hebrew version is no longer extant); Jewish Antiquities, in 23 books, containing the history of the countrymen from the earliest times down to the end of the reign of Nero (the fictitious Hebrew Josippon, which for a long time was identified with J.'s Antiquities, dates from the 10th c. A.D.); a treatise on Agriculture (c. 20 B.C.); a long and valuable chrestomathy of old historical writers; and an Autobiography (37—90 A.D.), in one book, which may be considered supplementary to the Antiquities. The other works attributed to him are not believed to be genuine.

The peculiar character of J. is not difficult to describe. He was, in the main, honest and veracious; he had a sincere liking for his countrymen, and rather a pious and devout enthusiasm in the old national history than he could well justify; but the hopelessness of attempting to withstand the enormous power of the Romans, and an aversion to martyrdom, caused him to side with the enemy:—perhaps in a vain hope of being, in some degree, useful to the national cause. The influence of Greek philosophy and learning is visible in all his writings, and, as far as biblical history is concerned, infused into it a tone of 'rationalism.' He speaks of Moses as a human, rather than a divinely inspired lawgiver; he doubts the miracle in the crossing of the Red Sea; the swallowing of Jonah by the whale; and, generally speaking, whatever is calculated to teach that there was a special miraculous Providence at work on behalf of the chosen people. His style is easy and elegant, and J. has often been called the Greek Livy. The editio princeps of the Greek text appeared at Basel (Froben) in 1544. Since then, there have been several important editions (in Greek) are those of Hudson (Oxford, 1720), Havercamp (Amst. 1729), Oehlrich (Leipz. 1782—1785), Richter (Leipz. 1825—1827), and Dindorf (Paris, 1845). J. has been frequently translated; the two best known versions in English are by L'Estrange (Lond. 1702) and Whiston (Lond. 1737).

JOYSHUA (Heb. Yeshuau, 'Jehovah helps'), the name of the celebrated Hebrew warrior under whose leadership the land of Canaan was conquered. He was the son of Nun, of the tribe of Ephraim, and was born in Egypt. Before the Israelites had reached Sinai, he was chosen by Moses to command the troops that fought against Amalek; and shortly before the death of the great lawgiver, he was publicly invested by the latter with the whole civil and military government of the Israelites. The vigorous and, on the whole, successful manner in which he pursued the conquest of Canaan, and distributed among the tribes, is minutely described in the book which bears his name. He died at the age of 110, and was buried at Timnah-Serah, in Ephraim. The so-called Book of Joshua, in its present form, containing an account of the earliest and division of the 'Land of Promise,' was neither written by him nor by any of his contemporaries; but the compiler has certainly made copious use, especially in the earlier chapters, of documents drawn up during the period of the conquest. Such passages as that relative to the harlot Rahab—

'and she dwelteth in Israel unto this day' (vii. 25)—demonstrate their own antiquity; but on the other hand, the compiler seems not to have heard of the capture of Hebron (of which there are several), which did not take place till after the death of J.; the frequency of the expression, 'unto this day,' in connections that forbid us to suppose the interval a brief one; the alliance between the nation and Israel as distinct (xii. 21); the lateness of many of the grammatical forms, &c., clearly indicate the gradual growth of the book under successive editors, the last of whom is placed by Masius, Spong, Hasse, &c., after the exile, and by Fabricius, the time of Manasseh; while Keil and others place the book in the time of Saul. A Samaritan Book of Joshua (Chronicon Samaritanum), containing a chronological narrative of events from the death of Moses down to the period of Hadrian, compiled from Arabic and Hebrew sources, about 1300 A.D., is extant in Arabic, and was first edited at Leyden in 1549, by Juyubell, along with a Latin version. It differs very considerably from the canonical Book of Joshua.

JOSIAH (Heb. Yashayahu, 'Jehovah will help'), one of the kings of Judah, was the son of Amon and Jedidah, and succeeded his father (641 B.C.) at the age of eight years. He was apparently brought up under the care of the priests, the priesthood, early received a pious disposition, and became a devoted religious reformer, purging Judah and Jerusalem from idolatry. In like manner, it seems, he marched through the land of Israel. This statement has naturally excited much surprise. For more than a hundred years, the kingdom of Israel had been a part of the Assyrian empire; its people were, for the most part, carried into exile, and their place supplied by heathen colonists. It was in the reign of J. that Hilkiah the high-priest found the 'Book of the Torah'—by which some understand Deuteronomy, others Exodus, and others, again, the whole Pentateuch,—while the workmen were repairing the temple. J. does not appear to have heard of its existence before; at least, the words of it strike him as something novel, and excite the profoundest emotions in his breast. In commemoration of the discovery, the king celebrated the feast of the Passover in great magnificence; and when the book was read to him, after this, he continued his work of extirpating every trace of idolatry. Wizards, conjurers, 'all the abominations' that could be 'spied in the land,' were 'put away.' In these efforts, the monarch seems to have spent the greater part of his reign. He met his death at Megiddo, in the valley of Esdraelon, when attempting to check the advance of Pharaoh-Necho against the Assyrians. (Compare Herod. II. 130.) J. was the last of the good kings.
of Judah. In his days prophesied Jeremiah and Zephaniah.

JOSIKA, MIKLOS (NICHOLAS), a very remarkable Hungarian novelist, was born of a distinguished family, 28th September 1796, at Torlia, in Transylvania. In his youth, he served for some time in the Austrian army, but resigned his commission in 1818, married a wealthy Hungarian heiress, and for many years devoted himself to agriculture and study. His first works appeared in 1834 under the title of József és Viola (and some exceedingly popular. From that period till the revolution in 1848, he wrote about 60 volumes of novels, all of which were published at Pesth. The most important are Az aboló Biblioték (The Lost Biblioték, 3 vols. 1840), Zrínyi a Kultó (The Poet Zrínyi, 4 vols. 1843). A Cseh Magyarországban (The Bohemian in Hungary, 4 vols. 1845), and Josika Istéin (Stephen Josika—one of the author's ancestors—5 vols. 1847). Involved in the Hungarian revolution, he was obliged to abandon his native country, and has since resided at Brussels, where he continues his literary labours. Among his productions written in exile, the best are Egy Magyar Család tízdalsom Atott (A Hungarian Family during the Revolution, vols. 1831); The Maidly Family (2 vols. 1850); and Ester (Esther, 1853). J. is a thoroughly natural novelist, and has drawn his materials almost wholly from the history of his own land, of which he possesses a most minute and profound knowledge. He has been called the Walter Scott of Hungary.

JOST, ISAAC MARKUS, an eminent Jewish scholar of Germany, born at Bernburg in 1793, died 1862. His principal works are Geschichte der Israeliten (History of the Israelites, 9 vols. Berl. 1820—1829), to which he added a tenth during 1846—1849, entitled Neue Geschichte der Israeliten von 115—1845; Allgemeine Geschichte des Jüd. Volkes (Universal History of the Jewish People, 2 vols. Berl. 1851—1852); a Translation (into German) of the Mishna with text and commentary (6 vols. Berl. 1832—1834); Gesch. des Judenheims, &c. (3 vols. Leipzig, 1857—1859). He also edited a journal entitled Israelitische Anzünder (Fkt. 1829—1841). Besides being a savant, he was a patriot, and warmly interested himself in behalf of the social and political liberties of his countrymen.

JOUJJPORE, a city in Rajpoetana, Hindustan, capital of a protected state of the same name, stands in lat. 26° 19' N., and long. 73° 8' E. The population, not accurately ascertained, appears to amount to at least 30,000. Besides several magnificent tanks, the place is remarkable for its elaborately constructed and deep wells. The state of Jouppoare is the most extensive and populous of all the principalities of Rajpoetana. Area, 3,672 square miles; pop. 1,783,600; army, 11,000; revenue of the rajah, £180,000. J. is chiefly within the basin of the Luni; and its central parts, being level and well watered, are highly productive, yielding wheat, opium, tobacco, and cotton.

JOUFFROY, THÉODORE SIMON, a French philosopher, was born 7th July 1736, at Pontets, a village of the Jura, early devoted himself to the study of philosophy, and became a teacher of it, and in 1822 a professor in the Collège de France. His bad health compelled him to resign his professorship in 1837, and he died 1st March 1842. His works consisted chiefly of studies of the Scottish philosophy, and he published translations of the works of Reid and some of those of Dugald Stewart with notes and introductory discourses. Of his original works, the most valuable is Milange Philosophiques (1823). He was also known as a political writer, and in 1824 took part in establishing the newspaper Le Globe. He represents the jongs at the churchyard gate of the picturesque little hamlet of Duddingston, within about a mile of Edinburgh. The jongs obviously take their name from a widely-spread root, which appears in the Sancer. unj, the G. sagnus, the Lat. jugum, the It. golgo, the Fr. joug, the Ger. Joich, the Ang.-Sax. horg, and the Eng. goller. The Braxi. (q. v.) were occasionally hung on the same pillar with the jongs.

JOULF, JAMES P., one of the most distinguished living experimental philosophers, was born in 1818, at Salford, near Manchester. In his youth, he had the good fortune to have for instructor in science the celebrated Dalton; and he early shewed, by constructing for himself electrical machines and other philosophical instruments, the bent of his genius. His earliest notable experiments were made with reference to electro-magnetic engines; from which he passed to quantitative determinations regarding heat, and the transformation of various forms of energy (see FORCE). He is justly entitled to be considered as the experimental founder of the modern theory of conservation of energy—the grandest generalisation ever made in physical science. A sketch of this principle is given if the article FORCE above referred to.

JOURS, JUGGS, or JOGGS, the name given in Scotland to a form of pillory which was used also in Holland, and probably in other countries. The jongs were nothing more than an iron ring or collar, fastened by a chain of two or three links to a pillar or wall in some public place, such as a market cross, a market troon or weighing post, a prison door, a church door, a churchyard gate, a churchyard tree, a tree beneath whose branches courts were held, and the like. The ring or collar opened by a ring or joint, so as to enclose the culprit's neck, when it was secured by a loop or staple, and a padlock. The jongs were employed as a punishment as well for ecclesiastical as for civil offences. They may be traced as far back as the 16th c., and although they have not been in use for the last hundred years, they may still be found hanging at a few country churches. The accompanying woodcut

Jours, JONGS.
Joupar—Jubilee.

Joupar, a town in the North-West Provinces of India, is situated on both banks of the Gumti, which is here crossed by an ancient bridge, so strong as to be periodically submerged without injury. Lat. 25° 44' N., long. 82° 44' E. This structure is commanded by a fort still older than itself, a work of the latter half of the 14th century. The population is 16,000. J. is the capital of a district of the same name, with an area of 1552 square miles, and about 800,000 inhabitants. Sugar is largely produced.

Jourdan, Jean Baptiste, Comte, a French marshal, born 26th April 1762, at Limoges, where his father was a surgeon. He early entered the army, embraced with great zeal the cause of the Revolution, and soon rose to the rank of a general of division. In September 1793, he obtained the command of the Army of the North, and on 10th October gained an important victory at Wattignies. In 1794 and 1795, he commanded the Army of the Meuse and Saumur, and prosecuted the war with great vigour and success. In 1796, he pushed his way far into Germany, but was driven back by the Archduke Charles; and this discomfiture led to his resignation of his command. In 1799, the Directory intrusted him with the command of the Archduke Charles on the Danube; but this Archduke Charles at Stockack. Although he opposed the coup d'état of 18th Brumaire, the First Consul employed him, in 1800, in the re-organisation and administration of Piedmont; and on the establishment of the Empire in 1804, he was made a marshal, and a member of the Council of State. He accompanied King Joseph to Naples, and afterwards to Spain, and in his service he was actively employed as a general. He offered his services to Napoleon, but on his return from Elba, Tous XVII. made him a count in 1815. In 1819, he was made a peer of France, but his republican principles led him to enter heartily into the revolution of 1830. He lived and died poor. His death took place on 25th November 1833.

Jousts, exercises of arms and horsemanship, performed in the middle ages by knights and nobles. In the joust, the combatants engaged one another singly, each against his antagonist, and not in a troop, as in the tourney. The number of courses to be run and strokes to be given was generally three, but sometimes a larger number. The weapon most in use in the joust was the lance, but sometimes the battle-axe and sword were employed. To direct the course of the lance or sword at the body of the antagonist, was reckoned foul play. In the joust of peace, or joute de plaisance, a foot-encounter preceded the mounted combat. In the 15th c., the modes of jousting had come to differ in different countries to such an extent, that an elaborate treatise was written in explanation of the various modes, distinguishing the characteristic differences.

Juplopped. See Jelllopped.

Juan. See Don Juan.

Juan Fernandez, called also Masatierra, a rocky island in the Pacific Ocean, about 400 miles off Valparaíso, on the coast of Chile, to which it belongs. It is 18 miles long, 6 miles broad, and is for the most part covered with high rocky peaks, the highest of which, Yangua, is about 4000 feet above sea-level. There are also numerous and fertile valleys, which yield oats, turnips, apples, strawberries, melons, peaches, figs, grapes, sandalwood, and other varieties of timber. Numbers of wild sheep and goats wander on the cliffs. A few settlers from the United States and Tahiti hold the island under lease from the Chilian government. Here Alexander Selkirk, a buccaneer, from the fishing-town of Largo, in Fifehire, Scotland, resided in 1704. It is commonly supposed to have suggested the idea of the Robinson Crusoe of Defoe, but this is doubtful.

Jubaea, a genus of palms of the same tribe with the cocoa-nut. J. spectabilis is a palm of 30 or 40 feet high, with a wide-spread crown of immense leaves; the native of Chili, where it is called Coquita. The Chilians cut off the crown, and collect the sap, which flows freely for several months, a fresh slice of the top of the stem being cut off every morning. A good tree will yield ninety gallons of sap, which being boiled down to a tenth—the consistence of treacle, receives the name of miel de palma (palm-honey), and is an important article of the domestic economy of the country. The Jubaea is, in fact, the Jaggery (q.v.) palm of Chili.

Jubilee, the Year of (Heb. Yovel), a peculiar institution among the Hebrews (Levitins xxv.), by which, every fiftieth (not forty-ninth) year, the land that in the interval had passed out of the possession of those to whom it originally belonged was restored to them. It was an attempt, all of which, except near poverty, and obliged to hire themselves out as servants, were released from their bondage; no less were (Jos. Ant. iii. 12. 3) all debts remitted. The jubilee forms, as it were, an exalted Sabbatical Year (q.v.), and was celebrated in manner similar to that of the former in the latter. The design of this institution was chiefly the restoration of the equilibrium in the families and tribes. It was to prevent the growth of an oligarchy of landowners, and the total impoverishment of some by others; as well as to increase the fertility of the soil and the growth of the population. It was proclaimed at the end of the harvest-time, like the sabbatical year, in the tenth day of the seventh month—the atonement—by the yobel (a kind of horn), hence also its name. There is no trace in the whole history of the Hebrews down to the Babylonian exile that the jubilee had ever been observed; after the return, however, it appears to have been rigorously kept, like the sabbatical year, for some time at least; but, from its general impracticability, it must soon have fallen into disuse. When the sabbatical year was de facto repealed by Hillel's Prudent (a legal document enjoining the creditor to some terms, viz., during this period), mention is no longer made of the yobel. The speculations of modern critics on the possibility of the yobel, and on the date of its inauguration, cannot prevail against the undeniable fact that it has been kept, and also that it is much more in harmony with the primitive theocratic character of the Mosaic institutions—according to which all the land was held as a kind of loan from Jehovah, who alone had an absolute right over it—than with those of any later period, to which it otherwise would have to be referred.

Jubilee, or Jubilee Year, an institution of the Roman Catholic Church, the name of which is borrowed from that of the Jewish jubilee. The Catholic jubilee is of two kinds—ordinary and extraordinary. The ordinary jubilee is that which is celebrated at stated intervals, the length of which has varied at different times. Its origin is traced to Pope Boniface VIII., who, issued, for the year 1300, a bull granting a indulgence to pilgrims of Rome during that year, on condition of their penitently confessing their sins, and visiting the church of St Peter and St Paul, fifteen times if strangers, and thirty times if residents of the city. The invitation to accept the indulgence is called Plenius. Innumerable troops of pilgrims from every part of the church flocked to Rome. Giovann
Villani, a contemporary chronicler, states that the constant number of pilgrims in Rome, not reckoning those who were on the road or returning during the entire year, never fell below 200,000. As instituted by Boniface, the jubilee was to have been held every hundredth year. Clement VI., in observance of an earnest request from the people of Rome, abridged the time to fifty years. His jubilee accordingly took place in 1350, and was even more numerously attended than that of Boniface; the average number of pilgrims, until the heats of summer suspended their frequency, being, according to Matthew Villani, no fewer than 1,000,000! The term of interval was still further abridged by Urban VI., and again by Paul II., who, in 1470, ordered that the nextjubilee every twenty-five years should be held as jubilee—an arrangement which has continued ever since to regulate the ordinary jubilee. Paul II. extended still more, in another way, the spiritual advantages of the jubilee, by dispensing with the personal pilgrimage to Rome, and granting the indulgence to all who should visit any church in their own country designated for the purpose, and should, if their means permitted, contribute a sum towards the expenses of the Holy War. The substitution by the pope of the fund for building St Peter's Church for that of the Holy War, and the abusive and scandalous proceedings of many of those appointed to preach the indulgence (q. v.), were among the proximate causes of the Reformation. In later jubilee years, the pilgrimages to Rome gradually diminished in frequency, the indulgence being, for the most part, obtained by the performance of the prescribed works at home; but the observance itself has been punctually maintained at each recurring period, with the single exception of the year 1800, in which, owing to the vacancy of the holy see, and the troubles of the times, it was not held.

The extraordinary jubilee is ordered by the pope out of the regular period, either on his accession, or on some occasion of public calamity, or in some critical condition of the fortunes of the church; one of the conditions for obtaining the indulgence in such cases being the recitation of certain stated prayers for the particular necessity in which the jubilee originated.

JUDAEA. See PALESTINE.

JUDAH (Heb. Yehuda, 'the Reprehended One') was the fourth son of Jacob and Leah, and founder of the greatest and most numerous of the twelve tribes. In the march through the wilderness, it had the pest of honour—the van—assigned to it; and tradition narrates that its standard was a lion's whelp, with the words: 'Arise, O Lord, and let thine enemies be scattered!' After the conquest of Canaan, its territories stretched from the Dead Sea on the east to the Mediterranean on the west (though the Philistines long held possession of the fertile district west of the mountains of Judah), and from Jerusalem (excluding that city) on the north to the land of the Amalekites on the south. The capital of the tribe was Hebron.

JUDAIANS. See EMINENTS.

JUDAS'S TREK (Orcidea), a genus of trees of the natural order Leguminosae, sub-order Caesalpiniose. The common J. T. (C. Silquastrum) is a native of the more temperate parts of Asia. It has almost orbicular, very obtuse leaves. The flowers, which are rose-coloured, appear before the leaves. There is a legend that Judas hanged himself on a tree of this kind. The American J. T. (C. Canadensis) is very similar, but has acuminate leaves. The flower-buds of both species are frequently pickled in vinegar. The wood of both species is very beautiful, veined with black, and takes an excellent polish.

JUDIE. EPISTLE OF, one of the smallest and least important in the canon of the New Testament, was placed among the Antilegomena (Doubtful Writings) by the primitive church, while some even considered it spurious. It was not made use of by the Asiatic churches until the 4th c., and does not appear to have been known in the West until the end of the 2d. Even those who quote it do so with hesitation, such as Clemens Alexandrinus, Origen, and Jerome. At the Reformation, similar suspicions revived, and were entertained first by Luther and Calvin, and afterwards by the Magdeburg Centurians and Grotius. In modern times, the tide of critical opinion has run strongly against its canonicity.

JUDGE is the generic descriptive name given to those who are invested with the power of judging and deciding causes in the highest courts of common law. In Great Britain—it is otherwise in America—it is not usual to designate the highest class of judges by the epithet of judge, and British law is not based on it. Thus, instead of saying Judge Blackstone, Judge Pollock, Judge Eldon, the proper description is—Mr Justice Blackstone, Chief Baron Pollock, Lord Chancellor Eldon, &c., according to the particular court in which they presided. In Scotland, the next highest to the name of a judge is a Lord; and the judges there, on their appointment, often assume new titles in addition to the prefix 'Lord.' In England, the judges of the superior courts are only called lords while they sit in court, and are often styled by counsel, but not by laymen. The practice has long been for the crown to confer the honour of knighthood on all the judges of the superior courts of law and equity in England, but not in Ireland or Scotland. All the superior judges are appointed by the crown, and since 12 and 13 Will. III. c. 2, have held their offices during good behaviour; since 1 Geo. III. c. 23, they have also continued to hold their appointments notwithstanding the demise of the crown. They can only be removed from their office on the address of both Houses of Parliament. They are all, except the Master of the Rolls, disqualified from sitting in the House of Commons. Judges have no privileges over peers, in respect of their salaries under the law, except that the common-law judges in England have the privilege of suing and being sued in their own court, though not of judging in their own causes.

The term judge has also been appropriated as the proper descriptive title of the judges of the county courts established in England in 1846.—Judge Ordinary, in English law, is the descriptive title of one judge only—viz., the judge of the Divorce and Probate Court. In Scotland, the phrase is often applied to all judges, superior and inferior, whenever they have a fixed and determinate jurisdiction, in contradistinction to commissioners, who have an occasional and temporary judicial authority delegated to them.

JUDGE-ADVOCATE-GENERAL, the supreme judge, under the Mutiny Act and Articles of War, of the proceedings of courts-martial. This officer is also the adviser, in legal matters, of the Commander-in-Chief and Secretary of State for War. On confirmation, the sentences of all courts-martial, with the evidence adduced, are submitted to him; and it is for him to represent to the commander-in-chief any illegality of procedure, or other circumstances rendering the proceedings unsound, that should be advised to confirm the court's decision. The judge-advocate-general receives a salary of
JUDGES—JUDGMENT.

£2000, and is a member of the House of Commons and of the ministry—changing, of course, with the latter. As it is essential that the judge-advocate-general should have an intimate acquaintance with the military law as well as with the general law of the land, he is provided with an assistant or deputy, whose office is permanent, and who is selected from among barristers of eminence. The Deputy-Judge-Advocate is an officer holding a temporary commission as public prosecutor in every court-martial. He must be an officer of intelligence, as it is part of his duty to examine and cross-examine witnesses, to warn the members of the court of any illegality in their proceedings, and generally to fulfill, in the limited area of the court, the functions which belong to the judge-advocate-general in regard to the whole army.

JUDGES, Book or (Heb. Sheftim), a canonical book of the Old Testament, recording the achievements of those heroes who, at different periods in the early history of the Hebrews, before the consolidation of the government under a monarchy from Joshua to Samuel, arose to defend their countrymen from the oppressions of neighbouring nations, but only three of whom, Deborah, Eli, and Samuel, were Judges in our sense of the word. The contents of the book are various and the //criticism. It cannot be said to be a history, properly speaking. The events recorded in it do not follow each other chronologically, nor is there an order of events obvious to be perceived in the management. It is rather a collection of detached historical traditions from the time of the Hebrew republic—probably redacted in the commencement of the reign of David—from ancient poems and popular sagas. It exhibits (whether with a royalistic tendency, as has been supposed by some, or in order to point the moral that however deeply sunk a people—emphatically the people—might be in slavery or idolatry, or both, God would always send them a deliverer from either at the right time) the lawless and ungodly state of Israel during the greater part of this period, and the evil consequences their intimate connection with the idolatrous nations around them brought upon them. The book naturally falls into two portions—the first, up to chapter xvi., containing the heroic deeds of the single 'judges'; the second, from chapter xvii., the two accounts of the idol of Micaiah, and of the crime of Beth-shan, which is often compared with that of Abel. The book extends of has of old been hotly contested; that it comprises no less than 300 years (cf. xi. 26) is, however, almost the only point on which we can feel certain, since there is no doubt that many of the events recorded in the book did not follow upon one another, but fell in the same period: a circumstance which chronologers generally have failed to take into account. The book itself differs considerably from the other historical books of the Bible by its simplicity and originality. That most of the heroic adventures related contain—sometimes, perhaps, under a highly poetical guise—true historical facts, has been doubted by but a very small number of critics. Ancient traditions make Samuel the author, or rather redactor of the book, and there is certainly little to be said against, and much for, this supposition. Compare Ewald, Wette, Rosenmüller, Studer, Keil, &c. See Jeva.

JUDGES' CHAMBERS means the place where a single common-law judge sits near Chancery Lane, London, for the purpose of informal man - days make applications of an unimportant nature arising out of actions pending in court. If the judge refuse, or decide wrongly, there is an appeal to the court of which he is a judge. In general, a judge sits at chambers all the year round to dispose of those applications, which are chiefly matters of form, but of urgency.

JUDGMENT is, in English Law, the term usually applied to the final determination of a common-law court in an action, and when the litigation is at an end. In the courts of equity, the more usual corresponding term is a decree or order, and in criminal and Admiralty courts, a sentence. All judgments of the superior courts are, as a general rule, capable of being appealed against (see APPEAL). When a judgment is not appealed against, or is a certain time allowed for the purpose, then it is final, and binding on the parties. If the judgment is registered, it will have the effect of preventing the judgment debtor from selling or alienating his lands, but in general has no such effect on his goods and chattels or personal estate, except money invested in government stock. In order to make a judgment effectual in an action of debt, if the debtor refuses to pay, a further process is necessary on the part of the creditor, called Execution (q.v.). In Scotland, judgment is usually called a Decree (q.v.), and judgment by default is called a decree in absence.

JUDGMENT. This familiar word of every-day discourse has a technical meaning in Logic, to which it corresponds as a legal maxim to the name of a judicial act. The //criticism. It cannot be said to be a history, properly speaking. The events recorded in it do not follow each other chronologically, nor is there an order of events obvious to be perceived in the management. It is rather a collection of detached historical traditions from the time of the Hebrew republic—probably redacted in the commencement of the reign of David—from ancient poems and popular sagas. It exhibits (whether with a royalistic tendency, as has been supposed by some, or in order to point the moral that however deeply sunk a people—emphatically the people—might be in slavery or idolatry, or both, God would always send them a deliverer from either at the right time) the lawless and ungodly state of Israel during the greater part of this period, and the evil consequences their intimate connection with the idolatrous nations around them brought upon them. The book naturally falls into two portions—the first, up to chapter xvi., containing the heroic deeds of the single 'judges'; the second, from chapter xvii., the two accounts of the idol of Micaiah, and of the crime of Beth-shan, which is often compared with that of Abel. The book extends of has of old been hotly contested; that it comprises no less than 300 years (cf. xi. 26) is, however, almost the only point on which we can feel certain, since there is no doubt that many of the events recorded in the book did not follow upon one another, but fell in the same period: a circumstance which chronologers generally have failed to take into account. The book itself differs considerably from the other historical books of the Bible by its simplicity and originality. That most of the heroic adventures related contain—sometimes, perhaps, under a highly poetical guise—true historical facts, has been doubted by but a very small number of critics. Ancient traditions make Samuel the author, or rather redactor of the book, and there is certainly little to be said against, and much for, this supposition. Compare Ewald, Wette, Rosenmüller, Studer, Keil, &c. See Jeva.

JUDGMENT (in Theology). The doctrine of a judgment after death has always been associated with the belief in man's immortality, and is maintained as a doctrine of natural religion on the ground of that responsibility of which conscience always more or less distinctly testifies, and of the evident absence of a due proportion of rewards and punishments to human actions in this life. This doctrine, however, as a doctrine of the Christian religion, contains many things of which there is no evidence apart from revelation. Thus, we are told of a day or time of judgment, when, in great solemnity, and in presence of an assembled universe, the judgment shall be pronounced; also, that the Lord Jesus Christ is to appear in glory as judge. As a doctrine of revelation, the doctrine of a final judgment is
also brought into close connection with that of the Resurrection (q. v.) of the dead.

JUDICIAL COMMITTEE OF THE PRIVY-COUNCIL, those members of the privy-council who sit at the court of justice in the hearing of appeals, &c. See PRIVY-COUNCIL.

JUDICIAL DECLARATION, in Scotch Law, means a declaration made by one of the parties to a suit, and who has been specially ordered by the court to be examined on a particular point. It is not a statement made on oaths. In England, this phrase is seldom used, though the same result is obtained by what are called admissions of the parties.

JUDICIAL FACTOR, in Scotch Law, is a person appointed by the Court of Session, on special application, as a guardian to protect the interests of minors, absent parties, and lunatics. In England and Ireland, the corresponding officers are, called receivers or trustees, according to circumstances.

JUDICIAL RATIFICATION, in Scotch Law, means the declaration made by a married woman in the absence of her husband, before a justice of the peace, to the effect that a disposition or deed of alienation of her heritable property has been made without coercion or fear on the part of her husband, and voluntarily by her part. Witnesses must also be present, and the former indorses on the deed a memorandum of the ratification. The object is to remove objections which might otherwise be made to the validity of the deed. In England, a corresponding phrase is a reference to an arbitrator or expert to report.

JUDICIAL REMIT, in Scotch Law, is a reference by a court or judge of a cause, or part of a cause, to the decision of an arbitrator or nominee, such as an engineer or accountant. The matter referred is generally some technical matter in which the referee is specially skilled. In England, the corresponding phrase is a reference to an arbitrator or expert to report.

JUDICIAL SEPARATION, in English Law, is the separation of two married persons by order of the Court of Divorce. Married persons may, if they please, mutually agree to live separate, and they may enter into a deed of separation for that purpose, which to some extent is recognised as valid by courts of equity. This is called voluntary separation, and it is made in the eye of the law. Married persons living apart are still married, and retain the status of married persons, and must sue and be sued in all respects the same as if they were still cohabiting. And a deed of separation is always revocable by the parties, though to some extent binding on each, if the other do not consent to renew the cohabitation. But when the parties have not mutually consented to separate, one of them can compel a judicial separation for certain grounds of misconduct. Thus, either party may apply on the ground of adultery, or cruelty, or desertion without cause for two years and upwards. The kind of crueltv which has been held a ground of judicial separation is difficult of definition.

The consequences of a judicial separation are as follows. The parties, not being divorced, cannot marry again; but there is no longer the duty of cohabiting. Part of the decree may consist of an award of a certain income to the wife after separation, and the court may make orders as to the custody and maintenance of children. But, irrespective of this, the wife becomes, to all intents and purposes, as regards her future property, in the same position as if she were unmarried. On the other hand, the husband is no longer responsible for

maintaining his wife, except so far as he may have been ordered to pay her alimony, and he is not liable for her debts. These laws have been declared in England since 1857, when the law was materially improved on the subject, and a new Divorce Court established.

In Scotland, the law has also been recently changed, and now nearly coincides with the English law in many respects, this improvement being made by the Conjugial Rights Act, 24 and 25 Vict. c. 86. By that act, whenever a decree of separation a moner et thoror is obtained at the instance of the wife, all property which she may acquire, or which may devolve upon her, is held entirely separate from and independent of her husband; she can bequeath it by will as if he was dead. She can also enter into contracts, and sue and be sued in her own name, and the husband is no longer liable for necessaries or her debts, except so far as he is bound by the decree of separation to pay to her alimony. As regards the grounds of judicial separation in Scotland, the same result is nearly the same, being, as in England, to be had by Mr Bell in his Principles thus: whenever life is endangered, or there is fair and reasonable ground of apprehension of personal violence, or there is continued annoyance, wearing out and exhausting the person, to the disgrace or shame of the adulterous party. It will, however, be found that the grounds of divorce are more ample in Scotland than in England. See MARRIAGE.

JUDITH, the heroine of an apocryphal and fictitious book [probably of the 24 c. r. c.; Movers, Mozes, &c.] called Judith, a beautiful Jewess of Bethulia, who perils her life and chastity in the tent of Holofernes, general of Nebuchadnezzar, in order to save her native town, by the assassination of the Assyrian commander. This she achieves, and escapes with the head of Holofernes to Bethulia. Her townsmen are inspired with a sudden enthusiasm, rush out upon the enemy, and completely defeat them. The tale is not mentioned by Josephus; and has, from an early period, been held to be an allegory; but it seems most probable that it is a legend founded on some real fact. It has frequently furnished poets and painters with subjects.

JUGGERNAUT. See JAGGERNAUT.

JUGGLERS (Fr. jongleurs), a term now almost synonymous with conjuror, and applied to persons who, with other instruments, have amused and entertained the professional musicians who attended the troubadours and troubéres of Provence and the north of France, either singing their poems, or, if they sung them themselves, accompanying them with an instrument, which was reckoned beneath the dignity of the poet himself. The word is derived from the medieval Latin juculator; in Provengal, joflar, joflador; in old French, jongleur or jongleur; in modern French, jongleur. These musicians soon began to be also kept in the service of kings and princes, whence they received the name of ministrels or minstrels (Lat. minister, a servant). The profession was at this time an honourable one, and good endowments were devoted to the maintenance of minstrels; and when the art of the minstrel ceased to be exclusively employed for the entertainment of courts, those of this profession formed a separate guild in some towns, as in Paris. But it gradually ceased to be also kept in the service of kings and princes, and when the art of the minstrel ceased to be exclusively employed for the entertainment of courts, those of this profession formed a separate guild in some towns, as in Paris. But it gradually...
with balls and rings (pistilli). But the greatest
producents in everything of this kind are and have for long ages been the Hindus and Chinese.

JUGLANS AND JUGLANDACEAE. See WALNUT.

JUGURTHA, king of Numidia, son of Mastan-
abal, who was a natural son of Masinissa, was care-
fully educated along with Adherbal and Hampsic, the
sons of his uncle Mucias, who succeeded Masinissa. After 33 years, both, J. soon caused Hampsic to be murdered (118 B.C.), and Adherbal fled to Rome. J. succeeded in bribing great part of the Roman senate, and obtained a decision in his favour, freeing him from the charge of the murder of Hampsic, and assigning him a larger share of the kingdom than was given to Adherbal (117 B.C.). But J. soon invaded Adherbal's dominions; and notwithstanding injudicious acts by the Romans to the contrary, succeeded in the town of Cirta (112 B.C.), and caused him and the Romans who were captured with him to be put to death with horrible tortures. Hereupon, war was declared against J. by the Roman people; but, by bribing the generals, J. contrived for yet another to have the Roman power. At last the consul, Q. Cecilius Metellus, proving inaccessible to bribes, defeated him in 108 and 109 B.C., so that he was compelled to flee to the Mauretanian king. Boccheius, Marins, who succeeded Metellus in the command, carried on the war against J. and Boccheius, till at last Boccheius delivered up J. to the Romans, who exhibited him at Rome in the triumph of Marius (194 B.C.), and then threw him into prison to die of hunger. J. had obtained greater prominence in history than he deserves, on account of Sallust's having written the history of the Roman campaigns against him.

JUJUBE (Zizyphus), a genus of spiny and decid-
uous trees, and small trees of the natural order Rhamnaceae. The species are pretty numerous. The common J. (Z. vulgaris) of the south of Europe, Syria, &c., is a low tree, which produces a fruit resembling an olive in shape and size, red, or sometimes yellow when ripe. The fruit is dried as a sweetmeat, and forms an article of commerce. Syrup of Jujubes is used in coughs, fevers, &c.; but the J. past, or Pâche de J., of the shops of Britain is made of gum-arabic and sugar, and is not of the dried jelly of this fruit. —The J. of India (Z. jujuba) is a similar small tree, with round or oblong fruit, sometimes of the size of a hen’s egg. —A Chinese species of J. (Z. microphylla) has a very pleasant yellow fruit about an inch long; and other species not much inferior are found in Africa, South America, and other warm countries. —The Lortes (Z. lotus), a shrub two or three feet high, a native of Persia, the north of Africa, &c., produces in great abundance a fruit about as large as a sloe, and with a large stone, but having a sweet farinaeous pulp, which the natives of some parts of Africa make into cakes resembling gingerbread. A kind of wine is sometimes made from it. —Z. Spion Christi; another native of the countries near the Mediterranean, is sometimes said to be the plant from the branches of which our Saviour’s crown of thorns was made, and is therefore called Christ’s Thorn and Jews’ Thorn. To which J. belongs, is said to be given to Puliurus aculeatus. The fruit is about the size of a sloe, oblong, and pleasantly acidulous.

JULIAN, surnamed the Apostate, on account of his renunciation of Christianity. Roman emperor 361 — 363 A.D., was born at Constantinople 17th Novem-
ber 331, and was the son of Julius Constantine, the brother of Constantine the Great. His proper name was Flavius Claudius Julianus. He and his brother Gallus, who were too young to be dangerous, were spared when Constantius II., son of Constantine, was assassinated at Linum. The two sons were, however, removed to a castle in Cappadocia, where they were subjected to a system of rigorous espionage. J’s life was very miserable, and the monkish education which he received produced not other result than a strong detestation of the religion professed by his tormentors. He was fond of literature and speculation, and he instinctively turned away from the rude asceticism, gloomy piety, and barbarous janglings of Homoniuuina and Hoinri styles, to the cheerfulness, refinement, and profound intellectual meditations of the old Greek philosophers. Some of his teachers appear to have been (secretly) pagans, for the sudden change in the state religion brought about by Constantine had necessitated a great deal of hypocrisy, especially among scholars and government officials. At the age of 20, J. was at heart a disbeliever in the divine origin of Chris-
tianity. On the death of his brother Gallus, he was removed to Constantinople to Milan, but was subse-
quently allowed to go to Athens, the home of Greek learning, where he gave himself up to philosophical pursuits, and enjoyed that cultivated society which he so highly relished. The emperor—though still zealous and in some measure convinced of the truth of Christianity—would not allow him to the title of Caesar, and sent him to Gaul to protect it from the incursions of the Germans. J. defeated the Alemanni at Strasbourg (357 A.D.), and com-
pelled the Germans to make peace. In his administration in Gaul was mild and judicious. His popularity, in consequence, became very great, and when Constantius ordered him to set out for the East, J.’s soldiers rose in insurrection, and he depended on the empire, who only reluctantly acceded to their demands. The death of Constantius at Mopsorene, in Cilicia, 3d November, 361 A.D., removed the only obstacle out of his way; and on the 11th of December he made a triumphal entrance into Constantinople. He now publicly avowed himself a pagan, but surprised both Chris-
tians and pagans by his edict of toleration. Yet he was not absolutely impartial, for he chose most of his officers from the professed followers of the old religion, and compelled the Christians to contribute to the restoration of the heathen temples. In 362 A.D., he made great preparations at Antioch, in the hope of bringing the war with the Persians to a successful conclusion; and in the spring of the year he advanced to Ctesiphon and across the Tigris, but want of provisions and treachery necessitated his retreat. He was followed and attacked by the enemy, who were repeatedly repulsed, but in one of the engagements he was mortally wounded by an arrow, and died 26th June 363. —J. was both a great monarch and a great man. His rule, com-
pared with that of many of the so-called Christian emperors, was just, liberal, and humane; and though only 32 years of age when he perished, he had com-
posed a great number of orations, letters, satires, and even poems (collected and published by Span-
heim in 1636). Among his lost works are his Refutation of the Christian Religion, and Memoirs of his German Campaigns, and his Diary. The cause of J.’s opposition to Christianity has been already indicated. We may say further, in elucidation of this important point, that J. appears to have been more attached to philosophy than religion, and that he more readily apprehended as truth what com-
manded itself to the intellect, than what spoke to the heart.

JULIAN CALENDAR. See CALENDAR.

JULIAN CROSS, or CROSS OF ST JULIAN, a cross crosslet placed saltireways.
JULIAN EPOCH. See Chronology.

JULIAN YEAR. See Year.

JULIEN, S. ANELIAS-AIGNAN, the first Chinese scholar in Euct. was born at Orleans, in France, 21st September 1799, and in 1823 became a pupil of Abel Rémusat, who had recently been appointed to deliver several lectures on Chinese. In less than a year, he had made himself master of the principal difficulties of the language, and actually executed (in Latin) a translation of the great Chinese philosopher, Mengius, which was published at the expense of the Asiatic Society of Paris (2 vols. 1824), and pronounced to be faultless. From this time, his labours have been chiefly directed to the languages and literature of the Far East. Ancient and modern Chinese, Manteu, Sanscrit, the Mongolian tongues, are familiar to him; although, at the same time, he is said to know almost the whole body of European languages. His translations (into French) embrace the most important works in all departments of Chinese literature. He has given specimens of the Chinese drama in his Hoi-lan ki (The Circle of Chalk, 1832) and his Tchao-chi kouen (The Chinese Orphan, 1834); of Chinese romances, by his White and Blue, or the two Snake Fairies (1834), and several other pieces which appeared in Solo winds and the Constitutional. J. is also the first who has succeeded in translating Chinese poetry well—the constant use of allegory, and allusion to facts not known to Europeans, rendering it nearly unintelligible. But more valuable still than those purely literary productions, are his translations of the great works that enable us to understand the religion and philosophy of the Chinese, such as the Book of Remarks and Punishments (1835), in which are contained the doctrines of Tao and Confucianism (The Book of the Way and of Virtue (1841) by Lao-zen, written in the 6th c. B.C., and forming the oldest and most illustrious monument of Chinese philosophy; and above all, the Liji, or Summary of the Life and Travels of Hsuen Tung (1832), a work of immense importance for the earlier history and geography of India, and the knowledge of Buddhism. But not content with these brilliant labours, J. has sought to instruct us concerning the industry and arts of the Chinese, in a variety of treatises, of which we may mention his Summary of the Principal Chinese Treatises upon the Culture of Mulberry Trees and Silk-worms (1837), and his Treatise on the Art of Manufacturing Porcelain (1856). He is also reported to have prepared a dictionary for a great Chinese dictionary. On the death of Rémusat, he became his successor at the Collège de France, and in 1855 president of the college. He is also conservator of the Bibliothèque Impériale, and is specially charged with the oversight of the Chinese department.

JULIUS, the name of three popes, of whom the second and third deserve to be noticed.—J. II., originally Cardinal Della Rovere, a nephew of Sixtus IV, was born at Albizola, near Savona. He was twenty years, he was opposed during his cardinalate to the designs of Alexander VI. for the aggrandisement of his family, and one of his earliest measures on his election to the pontificate, in 1530, was to resume possession of the duchy of the Romagna, which had been bestowed upon Cesar Borgia. J. was himself beyond all suspicion of nepotism or selfish designs of aggrandisement; but his public career during his pontificate was almost entirely devoted to political and military interests for the completion of the papal sovereignty in the territory—Bologna, Ferrara, &c., and for the extinction of foreign domination and foreign influence in Italy. In pursuing his designs, for the purpose of compelling the republic of Venice the restitution of the papal provinces on the Adriatic, J. not only entered into the league of Cambray with the emperor Maximilian and Louis XII. of France, but had recourse to spiritual arms, by placing the republic under a sentence of excommunication: and on the submission of Venice, apprehending the ambitious designs of Louis, he withdrew from the league, and entered into an opposite alliance, the 'Holy League,' to which Spain, England, and Switzerland were parties. He was also engaged in bitter quarrels with his sovereign, in which the latter attempted, but ineffectually, to enlist the sympathies of the church against the pope. The Council of Pisa, which was convened under his influence, was an utter failure; and the opposing council, fifth of the Lateran, assembled by J., but not brought to a close during his lifetime, completely frustrated the designs of Louis. It is alleged that, in his hatred of France J. was desirous of drawing even the Turks into the league; but this allegation is negatived by his entire career, one of the main features of which was a design for a holy war, in which he himself should take the command. As an ecclesiastical ruler, J. has little to recommend him in the eyes of churchmen. As a political sovereign, he is described by Ranke as 'a noble soul, full of lofty plans for the glory and weal of Italy;' and Professor See considers him, with all his defects, as one of the noblest characters of that age in Italy. He was the last of the Jesuit and judicious papacy, but was a friend of the rising literature of the time. He died February 22, 1513.—J. III., a native of Monte San Savino, near Arezzo, was known before his elevation to the pontificate as Cardinal del Monte. He was one of the four legates of the pope under whom the Council of Trent was opened; and after his election to the papacy in 1550, he himself re-opened (in 1551) that council, which had been suspended for upwards of three years. He is connected with English history as having sent Cardinal Pole to organise with Mary the reunion of the kingdom with Rome; but his general government of the church is marked by no very striking events, and his private character is admired by the taint of nepotism. He died March 23, 1555.

JULIUS, or JULIUS, a city of the Punjab, stands in the Doab of the same name between the Sutlej and the Beas, in lat. 31° 21' N., and long. 75° 31' E. Having once been the capital of the Lodi-Moghans, it is surrounded by a vast number of large and magnificent mausoleums. The soil of the neighbourhood is remarkably productive; and the place, though it is higher than any of its former greatness, is still celebrated by the antiquities.

JULIUS Terrestrial. was included in the Linncean genus J., and is still the family Julies of many naturalists. The genus J. as now restricted, contains many species, some of which are British. They are sometimes called Snake Millipedes and Gally-worms. They resemble centipedes in form; but their feet are...
more numerous—some having 120 pair—and are so weak that the animal seems to glide along on its belly, the feet moving like a wavy fringe on each side. The body is nearly cylindrical, not flattened. On an average it is 15 feet long, and 1 foot in diameter. The Julé have no poison-fangs, like centipedes. They inhabit moist and dark places, and feed chiefly on decaying vegetable substances, sometimes also on decaying animal substances.

JULY, the seventh month of the year in our civil calendar, is also in the Roman calendar, where it was called Quintilis (the fifth). Originally, it contained 35 days, but was reduced by Romulus to 31, by Numa to 30, but was restored to 31 days by Julius Caesar, in honour of whom it was named July (Lat. Iulius), on account of his birth having happened on the 12th of this month. It was called Mordi-month, or mead-month, and Rika-aeterna, or after-mild-month, by the Anglo-Saxons.

JUMBUSER, a town of British India, presidency of Bengal, is situated in the district of Bharuch, and 26 miles north-west of the town of that name. Pop. 10,000, who are principally employed in the cotton, grain, and coarse cloth trade.

JUMPILLA, a handsome town of Spain, in the modern province of Murcia, is situated in a delightful valley 33 miles north of the city of that name. Pop. 7,400, who manufacture firearms, earthenware, and tiles.

JUMNA, the principal feeder of the Ganges, is perhaps the only Indian river of the first class which has its course wholly in Hindustan—the Indus, Satlej, Ganges, and Brahmaputra all rising in Tibet. Its source, at a height of 10,849 feet above the sea, is in lat. 31° N., and long. 78° 32' E., at the south-west base of the Jummutri Peaks; and, after flowing 680 miles chiefly in a south-east direction, it joins the Ganges at Allahabad. After its first 100 miles, during which it receives many affluents, of which the Touse is the largest, it enters the plain of Hindustan in lat. 30° 20' N., and long. 77° 38' E., having still an altitude of 1,276 feet above the sea. Below this point, it is joined by many considerable streams: the Chumbul, the Sind, the Betwa, and the Cane on the right; and the Hindon, the Sonegour, and the Rind on the left. All the way downwards, the J. is generally shallow, and meandering as the former streams were, only for the sake of navigation. By artificial means, however, its waters have been rendered doubly available both for commerce and for agriculture. From either bank, a canal has been drawn at once for the use of inland craft and for the purposes of irrigation. The one on the right side, begun in 1356, leaves the main channel a short distance below the point of its emergence from the mountains; while the one on the left side, commenced in 1824, takes its irrigation a little further down, near the village of Fyzalod. Both of them join the parent stream at Delhi. Historically and politically, the J. occupies a more prominent position than the Ganges itself above their junctions, because the former was necessarily the first to cross the path of every invader from the north-west; and hence on it were built both Agra and Delhi, the two capitals of the Mussulman conquerors of India.

JUMMUTRI, the hot springs near the source of the Jumna, in lat. 30° 50' N., and long. 78° 32' E., 10,849 feet above the sea. Their temperature is 104° 7', nearly that of boiling water at their elevation. They are overhung by three connected mountains, known as the Jummutri Peaks, whose altitudes respectively are 21,155, 20,916, and 20,122 feet.

JUNCE, or JUNCACEA, a natural order of endogenous plants, herbaceous, generally perennial, with creeping root-stock; narrow, often fleshy leaves; regular flowers; the perianth 6-partite; the fruit a 3-valved capsule. The family order is nearly allied to Lilaceous, notwithstanding very great difference of aspect for rushes (Juncus) are the best known examples of it. The species, about 200 in number, are mostly natives of cold and temperate climates.

JUNE, the sixth month of the year in our calendar, but the fourth among the Romans. It consisted originally of 26 days, to which four were added by Romulus, one taken away by Numa, and other month again lost to 30 days by Julius Caesar, since whose time no variation has taken place. The Anglo-Saxons called this month scour-month, or dry-month, and midsummer-month.

JUNG, JOHANN HEINRICH, generally called JUNG STILLING, an author, the events of whose life and whose gifts of imagination render him worthy of notice, although at one time his merits were greatly over-estimated. He was born of poor parents at Ingrund, in Nassau, 12th December 1740, and after trying various occupations, became a student of medicine at Marburg, where he lived in intimacy with Goethe, who conceived a great liking for him, on account of his simple, pure, affectionate nature, settled as a medical practitioner at Elberfeld, and distinguished himself as an operator and physician. He is said to have improved the eyeglass of more than 2000 persons. J. subsequently held professorships at Marburg and Heidelberg. He died at Carlshuile, 24 April 1817. His first publication was an autobiography, Jan. 1741; . Jungengerichte, den Bleibt, geschrieben, welche ... 1817), which attracted much attention, and was followed by other publications from time to time, continuing the history of the author's career. In religion, J. represents a class by no means uncommon in Germany—viz., the Pietistic rationalists, men who put little stress upon the (written) word of God, but are full of veneration (often degenerating, however, into a mere sentimental enthusiasm) for the spiritual truths of Christianity. J.'s collected works were published (1838) at Stuttgart in 14 vols.

JUNGERMANNIA, a Linnean genus of cryptogamous plants, containing a great number of species, which, in different modes, are divided into many genera, and some have even formed into an order, Jungermanniaceae, although it is more generally regarded as constituting a sub-order of Hepaticae (q. v.). The distinctive characters of the sub-order are that the sporangia are open by four valves, and that the spores are mixed with elaters. The species much resemble mosses in appearance. Many are natives of Britain, some of them very common in moist places. The tropical species are very numerous, and some of them are to be found even on the young shoots and leaves of plants.

JUNGFRAU (the Maiden), one of the highest mountains of the Bernese Alps, rises on the boundary-line between the cantons of Bern and Valais, and attains a height of 13,720 feet. It received its name either from the unsullied purity and dazzling brightness of the snow by which it is covered, or from the fact that until recently no traveller had ever reached its highest point. In 1812, its summit was attained by six peasants from Grindelwald; and in 1841, by M. Agassiz and Principal Forbes, accompanied by others.

JUNGLE-FOWL, the name given by the Australian colonists to a bird (Mesohippus timbaudii), which has also been called the Mezapode, totally...
different from the jungle-fowl of India. See Fowl. It belongs to the family Megapodiidae. All the species are large birds, with short wings and tail, and of slow, heavy flight. They are remarkable for the thickness of their legs (tarsi), and their long and thick toes; and for their habit of keeping up mounds of earth, decayed leaves, &c., in which they lay their eggs, which are hatched by the heat produced by fermentation. The Australian J. makes heaps sometimes fifteen feet high, and sixty feet in circumference at the base, under the shade of thick trees or shrubs, where the heat of the sun may not evaporate the moisture. In these heaps, it makes holes of several feet in depth, in which to deposit its eggs. How the young birds emerge, is not yet known, nor if they are assisted by the parent birds. The mounds of the J. were at first supposed to be sepulchral tumuli. The J. is mostly of a brownish colour. Its size is rather less than that of the common domestic fowl. The propensity to heap up earth is very early manifested by young birds.

JUNIPER (Juniperus), a genus of trees and shrubs of the natural order Coniferae, sub-order Cupressinae, having unisexual flowers, the male and female generally on separate plants, and the fruit a fleshy berry (in popularly a juniper), containing three small nuts. The species are all evergreen, and have small, narrow, rigid leaves, which are opposite, or in whorls of three or four, or in groups in four rows. They are natives chiefly of temperate and cold regions, and are found in Europe, Asia, Africa, and America. —The Common J. (J. communis) is found in all parts of Europe and the north of Asia, and in the northern parts of North America. Only in favourable circumstances does it become a tree of 15, 20, or at most 30 feet in height, and in general it is only a shrub from 2 to 6 ft. high. The fruit takes two years to ripen; it is round, of a bluish-black colour, with a whitish bloom; it is of the size of a small currant, and is produced in great abundance. The little nuts or stones of the fruit have on the shell three glands, which abind, especially before ripening, in an essential oil. Oil of J.

Common Juniper (J. communis):

a. branchlet with male flowers;
b. part of branchlet with female flowers;
c. juniper fruit.

hard, and fragrant. When of sufficient size, it is much valued by turners. It is also used for veneering. The dry twigs, roots, and berries are used for fumigation. The berries have a strong and peculiar flavour. They are much used for flavouring gin, which derives its name from them (see Gin). They also enter into several medicinal preparations, being stimulant, sudorific, and diuretic. —The bark of J. may be made into ropes, and in some parts of the Highlands of Scotland, the roots are woven into the coarse baskets which are used for potatoes, peats, &c. —Oil of J. is lighter than water; specific gravity, 0.839. It is lipid and nearly colourless. It is obtained by distilling the nutripe fruit, or the twig, with water. The medicinal properties of J. depend on it; six drops are a dose. —Spanish J. (J. azedarach) grows in arid situations in the countries around the Mediterranean Sea. Its fruit is about the size of a hazel-nut; and from its fruit and wood is procured an essential oil of disagreeable odour, called Huile de Codex (q.v.), which is used in veterinary practice, particularly as a cure for scab in sheep. —Vincente J. ('J. patula'), from Central America, is an evergreen tree, often 30-50 ft. high, of conical form, with horizontal branches and very small leaves; a native of North America, from Lake Champlain to the Gulf of Mexico. It grows in sandy or rocky places. It is often planted in pleasure-grounds in Europe, and succeeds well in Britain. The berries are small and bright blue. The heart-wood is of a beautiful red colour, and is valued by turners, cooperers, &c. It is imported into England for making pencils. There are often found on the branches fumous excrecences called Cedar Apples, which have been recommended as a vermifuge. —The Bermudas Cedar (J. Bermudana) is a native of Bermuda, a genus with a fragrant reddish-brown wood, which is used for furniture, pencil-making, &c., and also for lining cabinets, its flavour preventing the attacks of moths and other insects. —The Himalaya Mountains produce several species of J., trees and shrubs of medium size, beautiful appearance, and valuable wood. The only species of J. which is a native of Britain is the Common J., and it is found chiefly in the more mountainous parts. —The Swedish J. of our shrubbery is merely a variety of the common juniper.

JUNIUS, Letteies of, a famous series of political letters signed "Junius," which appeared in a London newspaper, The Public Advertiser, during the last years of the administration of the Duke of Grafton and the first two years of that of Lord North. They were 44 in number; besides which, are to be reckoned as proceeding from the same pen 15 signed Phile-Junius, 62 business-letters (mostly very able and spirited) signed Junius, 10 to Lord North and 10 to Wilkes (privately); and in addition, 113 letters under various signatures. The first of the letters of J. published January 21, 1769, treats of the "State of the Nation," and may be said to strike the kernel of the argument. —In it, the author singles out several leading members of the ministry, and boldly denounces their inefficiency; and the last of the letters, dated January 21, 1772, closes somewhat suddenly the log, commending against ministers in the same spirit in which it had begun. No sooner did the first Junius appear, than the court-party took the alarm. An invincible and dreaded censor was evidently moving among them—one who, though as yet the days of parliamentary reports were still far off, seemed cognizant of all the proceedings of both Houses, who not only knew intimately the public career of ministers, but was fully informed regarding the follies and the crimes of the Duke of Grafton, which his close friends, who entered into controversy with this unknown adversary, was in the end overmastered, and reduced to mere humble complaint and confession. The Duke of Bedford, Lord Mansfield, and chief of all, the Duke of Grafton, wrote beneath his lash—the last of those being more indebted for immortality to the splendid sarcasm of Junius than to any measure which it was his fortune to introduce. It cannot, however, be denied that the hatred of Junius, though springing for the most part from his detestation of injustice, and his contempt for incapacity, were increased and imbibed by party
JUNK-JUNO AND HERA.

spirit and personal dislike. The style of these letters, though perhaps occasionally somewhat stiff and formal, is of the very highest class. Occasionally rising to the loftiest eloquence, it is always remarkable for closeness of argument, felicity of illustration and allusion, and brilliant epigram. Whoever Junius was, his life depended upon his preserving his nom de plume. He had made too many enemies to be safe in acknowledging himself. From the day of the publication of his first letter, however, conjecture has been busy framing theories of the authorship. Burke, Lord Shelburn, Colonel Barré, Lord George Sackville, Wilkes, Horne Tooke, Thomas Lord Lyttleton, among others, were supposed in turn to be Junius; but the general opinion now is, that Sir Philip Francis (q. v.) was the author of these letters. The Franciscan theory is supported by a weight of evidence, which, although entirely circumstantial, is sufficient, Macaulay thinks, "to support a verdict in a civil, nay, in a criminal proceeding." The handwriting of Junius is the handwriting of Francis slightly disguised. Junius, as is evident from his letters, knew the forms of the Secretary of State's office, was intimately acquainted with the business of the War Office, attended the House of Commons in 1770, and took notes of speeches, especially of those of the Earl of Chatham; denounced the promotion of Mr Chamier in the War Office as unjust to Mr Francis, and was bound by some strong tie to the first Lord Holland. All these circumstances in the position and actions of Junius, the unknown author of the letters, correspond exactly with the history of Francis, and do not agree in more than two points with the history of any other public man of that period. 'If this argument,' says Macaulay, 'does not settle the question, there is an end of all reasoning on circumstantial evidence.' See Junius, by Wood, published by Bohn (2 vols. London, 1880); and Macaulay's Essay on Junius (Warren Hastings).

JUNK, a Chinese vessel, often of large dimen-

incapable of much seamanship or speed, have proved themselves seaworthy on voyages extending even to America and Europe. The junk of Japan is considerably superior to that in use in China. Junk, in the British navy, is a familiar term for the saltiest supplied to vessels for long voyages; the name being probably derived from the fact that it becomes as hard and tough as old rope, pieces of which are officially styled junk. JUNKSEYI'ON, or SALA'NG, an island in the Bay of Bengal, lies in lat. 7° 46' N., and long. 96° 18' E., near the west coast of the peninsula. It belongs to Siam, and trades chiefly with the British settlements of Malacca, Penang, and Singapore. It yields tin, edible birds'-nests, and Japan wood.

JUNO AND HERA, the Roman and Greek names of the queen of heaven, and wife of the supreme divinity. The two conceptions have unfortunately been confounded, and hence their essential dissimilarity has been lost sight of—a dissimilarity, it may be remarked, as great as that which existed between the Roman and Greek character. We shall endeavour to distinguish between the two conceptions.

Hera (meaning 'mistress'), the Greek goddess, was the daughter of Kronos and Rhea. She was the sister of Zeus, and afterwards became his wife. Her jealousy is a matter of frequent discord between herself and her lord, whom, however, she greatly fears. She is represented as often spitefully favouring persons who were the objects of the displeasure of Zeus, and has to be punished for her disagreeable ways. Zeus scolds and even beats her; and on one occasion, we read of his having tied her hands, and hung her up in the clouds. But she is, nevertheless, a female of majestic beauty, the grandest of the Olympian dames. As the only wedded goddess in the Greek mythology, she naturally presided over marriage and at the birth of children. She rode in a chariot drawn by two horses; and in her famous temple at Mount Einboa, her statue, made of gold and ivory, bore a crown, symbolic of her queenly dignity. Her favourite residences were Argos, Sparta, and Mycenae; but she had sanctuaries in many parts of Greece. The Greek artists loved to represent her as a majestic woman of middle age, possessing a maternal dignity of mien, with beautiful forehead, large eyes, and venerable expression. Homer repeatedly calls her 'the venerable ox-eyed Hera.'

Juno (the name is from the same root as Jupiter), the Roman goddess, was the queen of heaven, and, under the name of Regina, was worshipped in Italy at an early period. She bore the same relation to women that Jupiter did to men. Like the Greek Hera, she took a special interest in marriage, whence her name of Juga or Jugalia (the yoke-maker); but she was also a kind of female Providence, protecting the sex from the cradle to the grave. Her epithets, Virginalis (the goddess 'of virgins') and Matrona ('of mothers'), indicate this. It is a very significant feature of the Roman character, that J. was also believed to be the guardian of the national finances, watching over her people like a thrifty mother and housewife. A temple, containing the mint, was erected to her on the Capitoline as J. Moneta (the money-coiner). She was besides the goddess of chastity, and prostitutes were forbidden to touch her altars. She had a multitude of other surnames, which we cannot afford space to enumerate. Her great festival was...
called the Matronalia, and was celebrated on the 1st of March. Her month (June) was considered the most propitious for fruitful marriages; and everywhere the Observantia of Christianity, this old Roman faith lingers superstitiously in the popular mind.

JUNOT, ANDOUCHE, Duke of Abrantes, and Marshal of France, was born October 23, 1771, at Bussy-le-Grand, in Côte-d'Or, entered the army as a volunteer, and distinguished himself in the early wars of the Republic. In 1793, he followed Napoleon to Egypt, where he created general of brigade, and particularly distinguished himself at Naarath, where he led a body of 300 cavalry, and put to flight 10,000 Turks, after a conflict of fourteen hours' duration. In 1807, he was appointed to the command of the army of Portugal. His army, after undergoing dreadful privations, reached Lisbon, and, with the greatest expedition, made himself master of all the strong places in the kingdom, and reorganised his army. For his brilliant conduct at this time he was created Duke of Abrantes, and appointed governor of Portugal; but being defeated by Wellington at Vimeira, he concluded a convention at Cintra, returned to France, and subsequently served in Germany, Spain, Portugal, and Russia. In 1812, he was disgraced by Napoleon for a supposed want of energy, and sent to Dijon. This, along with other causes, produced mental derangement. He was taken to his father's house at Moulhard, near Dijon, and two hours after his arrival, precipitated himself from a window (221 July 1813), and fractured his thigh-bone. Amputation was performed, but J. frantically tore off the bandages, and died some days afterwards. His wife, LAURE PERNON, the celebrated Duchess of Abrantes, has gained a reputation in the literary world by her Mémoires sur Souvenirs historiques sur Napoléon, la Restauration, le Directoire, le Consulat, l'Empire et la Restauration (Paris, 1831–1835), and by several minor works.

JUNTA, i.e., an association, the name given in Spain to a body of persons combined for any political or civil object. The term was formerly applied more exclusively to assemblies of representatives of the people meeting without authority of the crown, but has been extended to those of the most strictly legal character.

JUPATI PALM (Raphia tedierna), a palm which grows on rich alluvial tide-flooded lands near the mouth of the Amazon. The stem is seldom more than six or eight feet high; but the leaves are often 50 or 60 feet long, rise vertically from the summit of the stem, and bend out on every side in graceful curves, forming a magnificent plume. The leaves are perhaps the largest in the vegetable kingdom; they are pinnate, the leaflets about four feet long. The leaf-stalks, which are often twelve or fifteen feet long below the first leaflets, and four or five inches in diameter, perfectly straight and cylindrical, are almost like birds' quills in strength and lightness, when dried, of a soft substance, with a thin, glossy outer covering. They are used for various purposes, as for laths, window-blinds, &c. The interior part is soft enough to be used instead of cork.

JUPITER, or JUPITER, in Roman Mythology, was the greatest of the gods. The name is a modification of Dico tis pater, or Dispipter (Dis, or Dios = divus, heaven), i.e., the Father of Heaven or the Heavenly Father. As such, J. had all power over the phenomena of the skies; hence his numerous associations, such as Phoebus (the Sun-god), Tonans (the Thunderer), Fulminator (the Lightning-hurler), and Serenator (the Weather-cleaver). But he possessed still higher and diviner attributes. The future was spread out clearly before his all-seeing eye; the immorality of men was in his hands, and events were but the expression of his omnipotent will. But he was not careless of mankind. He revealed himself in a variety of ways to them, and taught men to interpret these mystic and symbolic revelations. In the sky were the media of his communications; hence his surname of Prodigalos (the Sender of Prodigies). As the national god of the Roman people, he went with them into battle (like the Jehovah of the Hebrews), fought for them, procured them victory, and, generally speaking, was their protector at home and abroad. This conception of J. is shown in such names as Imperator (the Ruler), Victor (the Conqueror), Statior (the Stayer or Stander-by). The strong sense of morality which marked the old Romans also found its expression in their view of the character of the best and greatest (optimas maximus) of their gods. J. was the guardian of law, justice, and virtue; oaths and solemn engagements were made as to him ('in the sight of God,' as we say). He had temples erected to him at Rome under all his different names; but the principal one was that on the Capitoline, whence he had the title of Capitolinus, and where, with beautiful statuary, the statues of Fides (Faithfulness) and Victoria (Victory) were placed beside his own. When consuls or other magistrates entered on the duties of their office, or when the army was about to open a campaign, or a general returned victorious from war, sacrifices were solemnly offered to J., and his favour invoked. When the Romans began to know the religion and literature of Greece, they foolishly sought to identify their own noble, majestic, and gravely upright J. with the slipper-y, lustful, and immoral Zeus of the Greeks. Hence have originated much confusion and misconception. See Zeus.

JUPITER as PLANETS; SOLAR SYSTEM.

JUPITER SERAPIS, TEMPLE OF, on the summit of this temple at Puzzuoli, near Naples, afford a remarkable instance of the changes which have taken and are taking place on the relative position of the land and water on the earth. Only three of the forty-six pillars of the temple are left; but the pavement of the temple being at present submerged; but they bear evidence that they have been at one time submerged to half their height, which is 42 feet. The base of the pillars as high as twelve feet is quite smooth; for the next nine feet they are penetrated by a boring shell, which is still active in the neighbouring rocks. The water must have covered this portion of the pillars, and while the molluscs were busy, the lower twelve feet must have been protected from their ravages by being buried in mud. The changes of level have been so gradual that the pillars have not been moved from their original position.

JUFOX, or JUST-AU-CORPS, a surname. The name 'jupon' is chiefly applied to the short tight form of that military garment in use in the 18th century.

JURA, a range of mountains, of a peculiar limestone formation, known as the Jura Limestone, extending from the angle formed by the Rhone and the Rhine, about forty miles, in a north-easterly direction (with a gradually declining elevation), for more than 400 miles, to the upper part of the course of the main. The Rhone, breaking through it between Schaffhausen and Basel, divides it into two parts, forming the frontier between Germany and France. The loftiest peaks are Reculet de Toiry, Grain, and the
JURA—JURY TRIAL.

Credoz, Dôle (which commands a splendid view of Mont Blanc), and Mont d’Or, all of which are between 6000 and 6000 feet in height. The Swiss Jura consists of a number of parallel chains with long deep valleys between, and over it roads have been carried with great difficulty; but the German Jura is more broken up by cross valleys. In lea parts of the range, the remnant is a low plain about seven miles wide, skirting the western border. Chief rivers—the Ain, the Doubs, and the Lune. The soil on the mountains is thin and stony, but yields abundant grass, upon which great numbers of horses and cattle are grazed from June to October; on the plain, the soil is rich, and grain-crops are produced in great abundance and variety. The wines of Arbois, of Poligny, of Etivie, and of Salins, have some reputation; 8,600,000 gallons of wine are produced annually. The mine of wealth of the department is considerable; the working of iron is one of the chief branches of manufacturing industry. Cheese is extensively made, and there is a good trade in timber. The department is divided into the four arrondissements, Lons-le-Saulnier, Poligny, Sainte-Claude, and Dôle. Capital, Lons-le-Saulnier.

JURA, one of the Inner Hebrides, lying off the coast of the mainland of Argyle, and having the island of Islay on the south-west. It is 27 miles long, and about five miles in average breadth. A ridge of bleak and rugged mountains traverses the whole length of the island, and rises in the Pope of Jura, in the south, to an elevation of 2306 feet. The west coast is deeply indented by Loch Tarbert and Loch Scridain, which separate this island from the mainland. The western shores are savage and rugged; the eastern are pleasing in appearance, presenting green slopes and a belt of plain. At the northern extremity of J., and between it and Scarba, is the whirlpool of Cornevreskin (q.v.). About 600 acres are under cultivation. Oats, barley, potatoes, and flax are produced; and black cattle are reared for export. Pop. (1861), 544.

JURA'SIC GROUP, the name given by continental geologists to the Oolitic series, because the chain of the Jura Mountains, on the north-west of Switzerland, is composed of these rocks. See OOLITE.

JURISDICTION, in Law, means the authority which a court or judge has to entertain a particular case and decide it. The general rule is, that if a court, which has no jurisdiction to decide a particular cause, asserts its authority, and renders a judgment, it is null and void. Many nice questions often arise on the question of jurisdiction, which are too intricate to be here stated. When the objection is taken to the jurisdiction in England, it is generally called a plea to the jurisdiction. In Scotland, it is called a peremptory. The result is included among what are called preliminary pleas.

JURISPRUDENCE is the science of law, which professes to discuss the principles on which legal rights should be protected and enforced, and which may be called the philosophy of law. This subject has been less cultivated in England than in continental countries, or even in Scotland; for, in England, the habits of the people and also of their lawyers are too practical to admit of spending time in discussing the elementary principles which are more or less vague and speculative. In its literal sense, the term means merely knowledge of the law, and seems to have been so used in the Roman law, five hundred years before our era, and of which no example is known. The word is often used in a popular sense in this country as synonymous with law, and it is also so used in France; but it is also and more correctly used in contradistinction to law, as implying the system or supposed methodical scheme embracing the principles on which positive law is founded. A distinction is sometimes made between general jurisprudence, which investigates the principles common to various systems of positive law, divesting these of their local, partitonal, and other accidental peculiarities; and particular jurisprudence, which confines itself to the particular laws of England, or France, or Scotland, as an independent system taken by itself. Jurisprudence thus embraces a wider range, as all those duties which are enforced between man and man; and yet it may be safely said, that lawyers, though dealing with the results of the science every day of their lives, seldom give any attention to the latent and general principles on which these results are founded. The only writers who have devetolped their attention to this speculative side of the law in this country are Bentham, whose various works abound with these discussions, and Mr Austin, whose Pronince of Jurisprudence Determined is an acute and masterly work on first principles, to whom may be added John Stuart Mill and Mr H. S. Maine.

JURY TRIAL (Fr. jure, sworn), is a mode of trial in the United Kingdom, by which a few citizens, selected for the purpose, are constituted the judges of the truth of the facts in suits between parties, and compelled to discharge this duty on the sanctity of their oath, but in subordinate to the judge who sits to determine the functions of control. Various theories have been adopted as to the origin and development of this characteristic feature of the administration of justice in the United Kingdom. Jury trial does not owe its existence to any particular law, which has grown up insensibly, and has become inertrically interwoven with the people’s habits. It was generally supposed, until recently, that our Anglo-Saxon ancestors had the credit of having mured the germ of this vigorous plant of liberty; and a cartoon in the new Houses of Parliament has embodied this popular belief. Recent researches have, however, shown that jury trial, as now known and practised, did not exist in those times, though it has been the natural development and successor of other rudimentary forms of trial then prevailing. Indeed, the germ of jury trial is found in human nature itself, and in some phase or other, is detected in almost every form of civil or criminal proceeding. The essence of it being a reference of disputed facts to the impartial judgment of a few men of average understanding and of nearly the same station in life as the litigants. In ancient Rome, a criminal trial was conducted before a presiding judge and a body of judges, taken from a particular class, whose duty it was to determine the fact of the guilt or innocence of the accused; but they could exercise the prerogative of mercy, which does not belong to the modern jury. The result of the former trial usual with the Anglo-Saxons has been summed.
JURY TRIAL.

up by Mr Forsyth in his History of Jury Trial, and he states these conclusions. Courts were presided over by arover, who had no voice in the decision, and the number of persons who sat was usually twelve. The assertions of parties were admitted as conclusive, when supported by the oaths of a certain number of concurrors. The testimony of the neighborhood was appealed to for the purpose of deciding matters of general concern. Sworn witnesses were appointed in each district, whose duty it was to attest all bargains and transactions, in order that they might be ready to give evidence in case of dispute. Every care was taken that all dealings between man and man should be as open and public as possible. It was by a gradual process of improvement that the precise functions of the jury were defined, and it would be beyond our limits to discuss the details of this progress. It will suffice to describe the institution of jury trial as it now exists, and has for centuries existed with little alteration.

In criminal cases in England and Ireland, there are two or three kinds of juries in requisition. In all cases of sudden death, homicide, or murder, the coroner of the district summons a jury of twelve men, who inquire into the circumstances of the death, and if it appear that such death was caused by the criminal misconduct of any person, the jury may find that such person was guilty of murder. This inquiry, or finding, is sufficient, without any other process, to put the alleged criminal on his trial, and the public prosecutor, or any private person, may proceed also against the prisoner in the ordinary manner. In all criminal cases, the grand jury is the medium of accusation. They perform the duty of juries in gaols, they do not try a prisoner, but all indictments are in the first instance submitted to their consideration, for the purpose of seeing whether there is enough of doubt and suspicion to make it necessary to put the accused on his trial. Accordingly, in every county and borough of England where sessions of the peace or assizes are held for criminal trials, a jury of not less than 12, nor more than 23 men, are summoned to see that there is some foundation for each indictment. The grand jury first charges them that, as it is their general duty to see justice done, they hear witnesses for the prosecution only and ex parte, finding a true bill, or ignoring the bill, according as they consider the case worthy of trial, or not, against the prisoner. See grand jury. The chief duty, however, as to the trying of prisoners is discharged by the petit jury, which consists of twelve men, who are sworn to try the cause between the crown, as prosecutor, and the prisoner. Previous to this trial, the prisoner is not, as a matter of course, entitled, except in cases of treason, to a copy of the indictment, though in many cases he can indirectly obtain a copy, or at least is generally made acquainted with the particulars of the charge against him. Nor is the prisoner entitled, except in cases of treason, to have a list of the witnesses who are to be brought against him. The first thing is to arraign the prisoner at the bar, and ask him if he pleads guilty or not guilty. If he do not plead guilty, he is then put on his trial. He is not entitled to demand from the court to have a counsel to defend him, though practically there is little difficulty in procuring one. The jury are then sworn. The number of jurors is twelve, but a much larger number is summoned, and the prisoner is entitled to challenge those of the jury who, he has good cause to believe, will be hostile to him. He can challenge a certain number of jurors without giving any reason; but when he exceeds such number, he must state some valid reason. The prisoner is not, however, entitled beforehand, except in cases of treason, to have a list of jurors summoned to him. At the trial, the prosecuting counsel begins by making a speech to the jury, commenting on the case. He then calls his witnesses, and it may be observed that it is a public duty for witnesses to attend, and they can be compelled, subject to the usual punishment, for refusal. Each witness is first examined by the prosecuting counsel, then cross-examined by the prisoner or his counsel, and then re-examined by the prosecuting counsel. A witness testifies on his oath, and he speaks falsely, may be prosecuted for perjury. After the prosecutor's case is closed, the prisoner or his counsel addresses the jury, and if he has any witnesses, calls them, and they are examined, cross-examined, and re-examined in like manner. If the prisoner calls witnesses, the prosecuting counsel has the right of making a speech in reply; and even where the prisoner calls no witnesses, the prosecutor can frequently insist on replying, and thus having the last word. The judge then sums up the evidence by going over it in detail, explaining any points of law that may arise; but he carefully informs the jury that it is for them exclusively to say whether, upon the evidence as laid before them, they think that the prisoner is guilty or not guilty. The judge must be unanimous in their finding. If they have a difficulty in agreeing, they are locked up a reasonable time, which means generally about six hours—though no definite limit is fixed—without food or water. Consequently, when the time has elapsed, they are unable to agree, they are discharged without a verdict. The consequence is that a new jury are summoned, when the same prisoner has been put on trial; yet it is supposed, he is guilty, it is for the judge exclusively to pronounce the appropriate sentence, and some discretion is allowed to the judge on that point. But neither the judge nor the jury can pardon the prisoner; it is for the crown alone to do so, and practically the propriety of doing so is left to the Home Secretary, whose duty it is, if any application reasonably supported by evidence is made to the crown, to inquire into it, which he does by examining the matter himself. It is supposed, that if the judge is satisfied, that no new trial can be had in criminal cases, even though some error may have been made by the judge or jury. The only mode of obtaining redress is to challenge the prisoner, or commit the sentence, as the case may be; and the Home Secretary advises the crown as above.

In civil cases, the established practice in England and Ireland is for most questions of disputed fact which are material to the case to be referred to the decision of a jury. It is the only regular mode of solving the dispute which the law provides. The necessity of a jury trial is arrived at after the parties have, by their mutual pleadings, come to an issue—i.e., one party distinctly asserts some fact which the other as distinctly denies, the fact being material to the cause. A jury is then summoned, and the rule is, that all causes of action are tried in the county in which the dispute arose. The jury consists of twelve persons. Jurors are either common jurors or special juries; the former act compulsorily, but are not paid for their loss of time; the latter also act compulsorily, but they are selected on the ground of their supposed superior intelligence, and they are paid a small sum for their services. In most cases, the plaintiff's counsel begins, and makes a speech to the jury; then calls his witnesses, and examinethem, and cross-examines them, and re-examines them, and if the defendant's counsel do not intend to call witnesses,
JUS REPRESENTATIONIS—JUSTICE.

England, there is no such absolute right of a widow to a share of a husband's goods, unless he died intestate, in which case, but in which only, she gets a share of the personal effects of the deceased by virtue of the statute of distributions. See Goods in Communion, Husband and Wife, Succession.

JUS REPRESENTATIONIS, a phrase adopted by the Scotch from the Roman law, to denote that in heritable succession, and also to a limited extent in movable succession, when one or more of the children of a deceased person have predeceased, the children of such predeceased children represent their parent, and take his or her share. Thus, if A die, and one of his children, B, had predeceased A, leaving children C, D, E, F, then C, D, E, F collectively take the share of A's property which would have come to B if B had survived A.

JUSSPORE, a protected state on the southwest side of Bengal Proper, is entirely surrounded by British territory. It contains 617 square miles and 27,000 inhabitants, and is a town of the same name. The country, a table-land, is much overrun with jungle, the cleared ground producing grain, chiefly rice, and oil, and the uncleared portions yielding in wild silk.

JUSVENTU, the name of a family which, for more than a century and a half, has numbered among its members some of the first botanists of the age. ANTOINE DE J., who was born at Lyon in 1686, and died at Paris in 1758, was Professor at the age of 23, and the author of various works on botany; amongst others, an Appendix to Tournefort (Lyon, 1719). He made several voyages and journeys to foreign countries for the purpose of collecting plants on which occasions he was accompanied by his younger brother, Bernard, who co-operated with him in all his investigations, and acted as his assistant.—BERNARD DE J., who was born at Lyon in 1699, and died in Paris in 1777, contented himself through life in assisting his brother and nephew, without seeking renown by the publication of his own important observations. Having been named superintendent of the gardens at the Petit-Trianon in 1709, he arranged the plants in accordance with a natural system substantially the same as that which his nephew and pupil, LAURENT DE J., successively elaborated in a more perfect manner. As Bernard refused to make publicly known the principles on which his mode of arrangement was based, the labours devoted to the systematic study of plants by John Laurens, who alone possessed the key to this botanical enigma,—LAURENT DE J., who was born at Lyon in 1748, and died at Paris in 1830, was worthy the rich heritage left to him by his learned and disinterested relatives. At the age of 17, he began his botanical studies under his uncle Bernard, and, four years later, was nominated demonstrator and assistant to Lemoine, the Professor of Botany in the Jardin du Roi. He at once began to reform the arrangement of the gardens and collections of plants under his charge, and to apply to them his own and his uncle's ideas in regard to the natural method. For thirty years he continued to develop his novel views; and though his work was long before it was finished in 1778, was finally completed in 1789, the natural system was finally established as the true basis of botany (see Botany). In 1793, J. became Professor of Botany in the newly-organised Jardin des Plantes, where he continued to labour till 1806, when blindness compelled him to resign his chair to his son Adrien. During his tenure of office, he founded the library of the Museum, which is one of the best in Europe. His papers in the Annales du Museum (from 1804—1859), and his articles in the Dictionnaire des Sciences Naturelles, rank among the most valuable contributions to the literature of botany, and embody all the results of his own investigations.—AUBRIE DE J., his son, was born at Paris on July 23, 1817, and died there, in the same city, June 22, 1853. From his earliest years, he had shown himself a worthy representative of the reputation of his family. As a youth, he carried off the honour of the Concours d'Invention competition among all the collegiate schools of Paris; and on taking the degree of M.D. in 1824, he presented as his thesis a memoir on the family of the Euphorbiaceae, which attracted the attention of all botanists. His subsequent papers on the Rauvolfia, Melaroca, and Malpighiaccea, fully realised the expectations that had been entertained of him. His memoir on the embryo of the Monocotyledons is a work of great merit, and was to have been followed by a series of papers on similar subjects, when ill-health compelled him to relinquish this project. He was also prevented, by the same cause, from extending his Cours Elémens de Botanique (1844) into a complete and general treatise. In 1851, he was elected a member of the Academy, and, shortly before his death, he was nominated to the presidency of that body. J. contributed many valuable papers to the Annales du Museum, the Courrier du Jardin, and the Bulletin du Muséum d'Histoire Naturelle; but the services which he rendered to science were not due only to his writings, for his influence as a lecturer was of even higher importance, and has been manifested by the contributions of all nations who have owed their training to him.

JUSTE MILIEU, a French term, signifying the just mean, or, according to the common expression, the golden mean. After the revolution of 1830, this term acquired a political signification, and came into very frequent use, because of the declaration of the organs of Louis Philippe, that the juste milieu was the only principle of government which could secure the welfare of France.

JUSTICE, one of the cardinal virtues of the ancients, and the name for a principal department of social and moral duty in all ages. Practically, justice is generally supposed to be clear and definite; but theoretically, there have been more doubts as to its ultimate analysis and the source of its binding quality. It has been maintained very generally, that both the perception of what is just and unjust in all cases, and the performance of the one, and in opposition to the other, are instincts of our nature, or make a part of that comprehensive instinct termed Conscience, or the Moral Sense. On the other hand, it has been held that utility, in other words, the general interest of mankind at large, is what determines justice, and that the sentiment enforcing it grows out of a regard to those interests.

The supposed instinctive origin of the sense of justice is enumberated with all the objections that attend the hypothesis of innate notions generally, so powerfully set forth by Locke in his Essay on the Understanding (see ETHICS). But neither is the other view free from various difficulties, of which the greatest is the universally felt contrast between the Just and the Expedient, or the simply useful. We are frequently called upon to sacrifice expediency to justice, which would seem to imply an obligation hopeless of satisfaction; for, as the true end of life is the happiness of the individual, Fait injuste, rire de bon cœur—Let justice be done, although the universe should founder. Whence arises this paramount obligation?

If we inquire into the nature of justice by examining the particulars coming under it, we find such instances as the following: It is unjust to deprive a
man of his personal liberty, his property, or any other thing belonging to him by law; justice, therefore, requires us to respect each one's equal rights. Sometimes, however, we call the law itself unjust, in which case we sympathise even with disobedience to it. It is then supposed that there is some higher law that should have preference—as, for example, the moral law. Thus, it is conceived by most men at the present time that feeling of the present fellow-creatures in slavery. Again, it is considered unjust to break faith with any one; in other words, promises and engagements must be fulfilled in order to do justice. It is unjust to show partiality in cases where all are equally entitled to favours. Impartiality in public tribunals is of the very essence of justice. Nearly the same idea is expressed by the notion of equality. In all these cases, there are some definite individuals—one or more—that are considered to be possessed of a right, and to be wronged if that right is not fulfilled. Herein lies the difference between justice and Benevolence or generosity, this last being the mere overflowing of our dissinterested fellow-feeling, which no one can claim as a right, and for whose neglect we are not punished.

These particulars, which are among the most marked instances of the property in question, do not suggest any qualities present in all just actions, and absent in the opposite, that characterise the existence of a so-called right on the part of somebody, and also the sentiment which demands the punishment of those that violate those rights. We are near the solution of the original question, which is, Why should those rights be either determined or enforced on any other ground than expediency, or the well-being of mankind? It is admitted on all hands that the just and the expedient concur in the long-run, but yet we do not clearly see why all the actions of the text of justice. Probably, there is something peculiar in the application of the term 'expediency,' which is the cause of the apparent paradox whereby the two qualities are made the same, and yet not the same.

This is really the case. Of the social regulations that affect the well-being of mankind, there are two widely different classes. In the first place, there are the interests of SECURITY, or those reunions without which human society could not be maintained. Liberty, life, and property, and the performance of engagements, are essential to the very existence of human beings in society; if these cannot be enforced, if offenders in these points will not, for the most part, with impunity, disorganise and ruin the social state, it becomes an inevitable consequence. The strength of the sentiment that injustice calls forth is therefore not a matter of surprise; existence is at stake, and whatever be the force of our impulse of self-preservation, and our desire of the preservation of our fellow-beings, the same will be the measure of our repugnance to the acts that endanger both the one and the other. Compare these interests with another class of things, also for the good of society, as, for example, the promotion of trade, manufactures, or science, all which are very advantageous to mankind, but not absolutely essential to our existence. They at most express the difference between two grades of happiness, not between the two grades of happiness. The contrast between the just and the expedient may now be apparent; both relate to the welfare of mankind; but the one is concerned with having, the other with well-being. The concept of Oliver Cromwell's. The one is so inamissable superior in point of urgency to the other, as to account for the very different degrees of our attachment to the two interests. The superior influence of justice, therefore, we may say, law is the same consideration; in fact, the argument is an identical one. We can live without generosity, or with some very small share of it; a thoroughly selfish community, if not also very short-sighted as well, might exist; but, even if the community where justice was nowhere observed, could not exist. Still, the grounds of justice are and can be no other than general utility. 'If,' says Mr John Stuart Mill, 'that expression does not seem to convey a sufficient account of the peculiar energy of the sentiment, it is because of the extraordinarily important and impressive kind of utility which is concerned. The interest involved is that of security, to every one's feelings, the most vital of all interests. All other earthly benefits are needed by one person, not needed by another; and many of them can, if necessary, be cheerfully foregone, or replaced by something else; but security no human being can possibly do without; on it we depend for all our immunity from evil, and for the whole value of all, every good beyond the passing moment, since nothing but the gratification of the instant could be of any worth to us, if we could be deprived of everything the next instant by whoever was momentarily stronger than ourselves. Now, this most indispensable of all necessaries, after physical nutrition, cannot be had unless the machinery for securing it is provided and preserved. Our notion, therefore, of the claim we have on our fellow-creatures to join in making safe for us the very groundwork of our existence, gathers feelings around it so much more intense than those concerned in any of the more common cases of utility, that the difference in degree becomes a real difference in kind. The claim assumes that character of absoluteness, that apparent infinity, and unmeasurability with all of which only such moral duties constitute the distinction between right and wrong, and that of ordinary expediency and ineffectiveness. The feelings concerned are so powerful, and we count so positively on finding a responsive feeling in others (all being social animals), that ought and should grow into must, and recognised indispensability becomes a moral necessity, analogous to physical, and often not inferior to it in binding force.'—On Utilitarianism.

If there were such a thing as intuitive, eternal, and immutable justice, independent of all the concerns of this world, and paramount over the highest interests of mankind, it ought to be something very clear and distinct; we should be the judges of all ages and nations, being revealed to the human mind without any reference to men's outward circumstances. But, not to repeat the arguments that refute this notion as respects morality in general (see Erratics), it may easily be seen that as to justice in particular there is a very great disagreement among mankind in everything except the first essentials of social security—namely, the respect for legal rights, the keeping faith, and the like. These things men in all ages have recognised as a part of justice; but in the things less essential to the common safety of mankind, where notions of just and unjust are still admitted and pleaded, there is anything but unanimity of opinion; nay, what is considered just in one country or nation is considered unjust in other countries or other times. Prorogation is one example; slavery is another.

JUSTICE, COLLEGE OF. See College of Justice.

JUSTICE, LORD CHIEF, the title given in England to the chief judge of the Courts of Queen's Bench and Common Pleas. The chief justice of the common court is called the Lord Chief-justice of England,
JUSTICE OF THE PEACE.

while for other is merely the Lord Chief-justice of the High Court of Common Pleas.

JUSTICE OF THE PEACE, in England, is a person appointed by commission of the crown, or by act of parliament or charter, to exercise certain judicial authority in a county or borough. The person who practically appoints to the office is the lord chancellor, who in his discretion may include in the commission certain persons who must have an estate of £100 a year, clear of all rents and charges; or if he has no estate in possession, but is entitled to the reversion thereof, if it be of the rent of £300 a year. All persons having the above qualification may be appointed justices of the peace; but practising attorneys or solicitors are not eligible for counties, though they are for boroughs. The office of justice of the peace is entirely gratuitous, for they receive neither salary nor fees, and hence the justices are often called the 'great unpaid.' But in modern practice, it has been found necessary to deviate from this rule, and to appoint in all the cities and many large towns certain paid justices called stipendiary magistrates at a fixed salary, who discharge the duties of justices, which are necessarily onerous and important. In the city of London and certain other places, however, and certain corporations are constituted by charter justices of the peace by virtue of their office.

The institution of justices of the peace is very ancient. Previous to 1277, there were conservators of the peace in every county chosen by the freeholders out of the principal men of the county to perform similar duties, but by a statute of Edward III., a change took place in the practice, and ever since the election of justices has been taken from the people, and exercised by the crown. At first, however, they were still called merely conservators or keepers of the peace, and were not dignified with their present title. Gradually, the office grew more and more important, in consequence of many statutes adding to their duties and jurisdiction, until, in the thirteenth year of the reign of Elizabeth, the form of commission was revised, and was settled nearly in the form which is now used. The commission, in the name of the sovereign, addressed to certain persons by name, and directing them 'to keep our peace in our county of —, and to keep all ordinances and statutes for the good of the realm and the good rule and government of the people, and to chastise and punish all persons that offend against the said ordinances.' The commission then assigns them to inquire 'by the oath of good and lawful men of all manner of foleleys, posessions, enchantments, sorceries, arts, mage, trespasses, forestallings, regratations, engrossings, and extorutions whatsoever, and of all crimes and offences.' Formerly, it was usual to select the most eminent to be of the quorum, a name derived from the first word of the clause quorum alium venire et veniendum, and one of these must always be present; but now nearly all are included in the quorum clause; and it is no longer an objection to a warrant that one of the conservators is not on the quorum. When new justices are appointed, the commission is sent by the clerk of the peace to the crown-office, where the names are inserted. On appointment, the justice must take an oath that he possesses the necessary estate as a qualification; and if he act without taking such oath, he incurs a penalty of £100. Each justice, on appointment, also takes the oath of allegiance, supremacy, and abjuratio. The appointment of a justice of the peace has always stood high in popular estimation, and is eagerly sought after by men of station, especially in the country. As the appointment is practically in the hands of the lord chancellor, it is a frequent charge brought by one political party against another that the appointments are given as rewards for political service; but owing to the frequent alternation of power among parties, the undue precedence of one set of politicians is specially neutralised by the appointment of justices.

The functions of justices of the peace are exceedingly multitudinous in the present day, for there are few departments of the law in which the aid of justices is not required for purposes either of administration or of judicial decision. For the last century especially, there has been a continual addition to their duties created by successive acts of parliament, and this is caused by certain remedies which either did not exist, or being created, by their being transferred from other courts and jurisdictions to the summary powers of justices. Of late, about twenty statutes every year involve material alterations, chiefly by way of addition to this branch of the law. To enumerate all the heads of law which in part have been confided to the disposal of justices, would require too much space; but it may suffice briefly to indicate the general character of their duties. These are either administrative or judicial. Thus, and chief of the many duties arising from the poor law, if the parish officers require to remove a pauper from one parish to another, instead of intrusting this power to other officers, they are required to go before justices of the peace, so as to shew the circumstances under which the removal takes place, and to satisfy the justices that the statutes on the subject have been complied with. But the great and distinguishing functions of justices of the peace are the judicial decision of what are called offences punishable by means of summary convictions or orders. The theory on which all this jurisdiction is founded is, that while the graver crimes must be left to the ordinary authority of the courts, the lighter wrongs to that of an action at law, there are many intermediate offences which are not worthy of the solemnity of an indictment, nor yet fit to be left to the slow, expensive, and often clumsy result of a civil action. Hence this intermediate class of offences, which justices can punish by fine and imprisonment swiftly and decisively. Thus, if certain classes of servants employed in agriculture or mechanical arts are guilty of any evil and injurious act, like the raising of crops when mischief is done, or ofFabianism, or of their being fined or imprisoned by justices, for if there were no speedy remedy like this, the mischief often caused to the master might go unredressed. In like manner, justices punish poaching offences, whether against fish or game, personal assaults, vagrancy offences, &c.

Another important class of duties consists in the preparatory proceedings of all criminal trials, as issuing the warrants to arrest, and examining witnesses so as to see if there is a prima facie ground of suspicion sufficient to warrant the committal of such persons to be tried before juries. There are also various offences of the class of misdemeanours which justices are entitled to try with the aid of a jury at quarter sessions, but none of these are intrusted to their jurisdiction. The courts composed of justices are general or quarter sessions where indictable offences may be tried by juries; and petty sessions are courts where a great variety of judicial and administrative business is performed. All these duties are not only performed gratuitously, but the justices are liable for mistakes often of a very innocent description, and have to pay damages on the injuries they cause to third parties. They are protected to some extent, so far as they have acted judicially, but if anything
like malice can be proved against them, they seldom escape being sued and answer'd in the courts of impeachment.

As regards Scotland, the first act establishing justices was that of 1587, c. 82. The office was further regulated by acts in 1699, 1617, 1633; by instructions during the Protectorate in 1655, embedded in the act 1661, which is the principal statute regulating the duties of justices. Two justices are held to form a quorum. The jurisdiction of justices is confined in practice to the penal statutes in reference to revenue, highways, filthings, gaming, and public-houses, the majority of these tribunals having cumulative jurisdiction. Their ordinary criminal jurisdiction is confined to breaches of the peace, petty thefts, and trifling assualts. They appoint a procurator-fiscal or public prosecutor for their own court. The civil jurisdiction of the sheriff and his lieutenants is chiefly confined to the small-debt court. In many counties, the sheriffs' small-debt court is the only tribunal resorted to. No particular qualification as regards rank or property is essential. The appointment is less popular, and the authority is less extensive than elsewhere, and jurisdiction, as just shewn, is much inferior to what it is in England. This is chiefly due to a different arrangement of judicial business, and to the antiquity of the practice of local sheriff courts in Scotland. Their origin is lost. They are presided over by trained-council lawyers, who are paid a fixed salary. These officers absorb much of the multifarious jurisdiction exercised by justices of the peace in England.

JUSTICE-CLERK. Lord, a high judicial officer in Scotland, being the second highest judge in point of rank, and in the absence of the Lord Justice-general, the presiding judge of the Court of Justiciary. His usual duty is to sit as chief of one of the divisions of the Inner House called the Second Division of the Court of Session (q. v.). The office in its origin was, as its name imports, of a more humble character.

JUSTICE-GENERAL. Lord, the highest judge in Scotland, also called the Lord President of the Court of Session. Formerly, the office of Justice-general was a sinecure, and not a judicial office, but the title is now, since 1831, associated with that of the Lord President.

JUSTICES, LORDS. From the times of the Norman and Plantagenet kings, it has been the occasional practice in England for the sovereign to appoint one or more persons called Lords Justices, to act as his representatives in the government during his absence from the kingdom. Subsequent to the Revolution, these appointments have been made by letters patent under the great seal, and the authority of parliament has sometimes been required in confirmation of their powers. On five occasions, such appointment was made by William III. when going abroad, though while his queen was alive, he delegated his authority to her during his absence. The statute 12 and 13 Will. III., settling the succession on the crown of Hanover, provided 'That no person who shall hereafter come to the crown shall go out of the dominions of England, Scotland, or Ireland, without consent of parliament; but this clause is negatived by 1 Geo. I. c. 2, and the first sovereign of the House of Hanover, during five of his absences in Germany, made an appointment of Lords Justices. George IV., on his visit to Hanover, delegated his authority to 19 guardians, of whom the Bishop of Yalden, heir-presumptive, was one. On none of the absences of her present Majesty from her kingdom has there been any delegation of the royal authority; and on one of these occasions, Lord Chancellor Lyndhurst stated in the House of Lords that the law officers regarded it unnecessary in point of law to appoint lords justices, in which opinion he concurred. In case of the sovereign's minority, a regency has generally been established, and the powers of lords justices have been usually limited in the matter of pardoning and reprieveing criminals, summoning or prorogation of parliament, the disposal of public moneys in the treasury, and of church preferment in the gift of the crown. The lords justices appointed under the commissions of 1719 and 1729 could continue the existing parliament by short prorogations, till otherwise directed under the royal sign-manual—the other acts here specified could not be issued without the special signification of the royal pleasure, except when necessary for the public service. The power to create peers has only once been delegated, by Charles I. in 1644; and Lord Herbert, afterwards Earl of Ohamorgan, in whose favour the right was exercised, was, after the Restoration, compelled to resign by the House of Lords.

Lords justices have sometimes been appointed to carry on the government of Ireland in place of a vice-regent; in modern times, this has only been done during occasional absences of the lord lieutenant, or in the interval between the demise of one lord lieutenant and the appointment of his successor. These lords justices have usually been the Lord Primate, the Lord Chancellor, and the Commander of the Forces.

JUSTICES' CLERK, an officer, generally a solicitor, appointed by justices of the peace in England to assist them in their duties. Owing to the justices themselves being trained lawyers, and yet being called upon to administer many branches of the law, and construe acts of parliament, all of which require much skill, the justices' clerk is a person of much local influence, and in practical effect guides and controls the justices in the form of advice. He is, properly speaking, not a public officer, but in the nature of a servant of the justices. By various statutes, he is entitled to receive fees in connection with the business transacted by the justices.

JUSTICIARY COURT, the highest criminal court in Scotland. Its judges are five of the judges of the Court of Session—viz., the Lords President, Justice-clerk, and three others appointed by patent. The quorum of the high court consists of three judges. It sits usually in Edinburgh, but also holds circuit-courts twice a year in some of the largest towns, and three in Glasgow, the kingdom being divided for that purpose into three divisions or circuits. The jurisdiction extends to all crimes whatever; and it is an appellate court as regards inferior criminal tribunals. Its decisions are final, there being no appeal to the House of Lords.

JUS'TIFIABLE HOMICIDE is the killing of a human creature without incurring legal guilt, as where a man is duly sentenced to be hanged; where one, in self-defence, necessarily kills another to preserve his own life, &c.

JUSTIFICATION, one of the most common terms of technical theology. In Protestant theology, it expresses an act of divine favour whereby a sinner is absolved from the penalty of his sins, and accepted as righteous, not on account of anything in himself, but on account of the righteousness of Christ imputed to him. According to this view it is a purely forensic act—the act of a judge sitting in the forum, or place of judgment, and acquitting the condemned by an exercise of clemency, in consideration of the merits of another, who has paid the penalty which was justly his due. In this forensic sense the word the apostle is understood by Protestants to speak (Rom. iii. 26) of God as 'the justifier of him which believeth in Jesus.'
In the doctrinal system of the Roman Catholic Church, justification is considered not purely as a forensic act, or act of acquittal, but, further, as an infusion of personal righteousness, and as hence equivalent to what Protestants specially call sanctification. The distinction between the two things is in Protestant doctrine a cardinal distinction—the one being the act of justification, the other proceeding from the divine clemency or grace once for all, the other, from the progressive agency of the divine Spirit. A corresponding distinction is likewise found in the Catholic system between the act of justification and the state or condition of habitual justice.

This doctrine of justification is laid down most plainly in the Epistles of St Paul, and it has always been the fundamental principle in this respect between these writings and the Epistle of St James. Whereas the one says: 'For if Abraham were justified by works, he hath whereof to glory; but not before God. For what saith the Scripture? Abraham believed God, and it was counted unto him for righteousness.' The other says: 'Was not Abraham our father justified by works? Yea, to declare his works, he was called the friend of God.' The evident conclusion is, that the Apostle Paul is describing the inward reality of justification, which has no dependence upon works, but only upon faith, while St James is speaking of its outward manifestation—of its reality and observance in the Christian character and conduct, which necessarily expresses itself in good works, without which, in this sense, there can be no justification. Justification, in short, is independent of works in its origin and primary condition. Its origin is the grace of God—its only primary condition, acceptance of this grace, or faith. But it is dependent upon works as its essential manifestation. Faith is not passive, but active; and a faith which is not active, which is not a spring of earnest Christian activity, is not a true faith. Such a faith cannot justify a man.

JUSTIN, a Roman historian who flourished, in all probability, in the 3d or 4th c., although some assign him an earlier date. His History—which is of great value, from its being our only authority on many important points—is partly a selection of passages from the Universal History of Trogus Pompeius, a work now lost.

JUSTINIANUS (JUSTINIAN) I., FLAVIUS ANICIUS, nephew, by the mother's side, of the Emperor Justin, was born 483 A.D., in the village of Tauriscum, which afterwards grew into the splendid city of Justiniana, and on the site of which the modern Kustendje stands. Although of obscure parentage, he shared the success of his maternal uncle, Justin, being invited at an early age to Constantinople, where he received a careful education, and if the reports of his courtly biographers can be accepted, attained to considerable eminence in philosophy, theology, and law, as well as in the more elegant pursuits of poetry, music, and architecture. On his uncle's death, in the year 518, he was created to the purple in 518, he appointed J. commander-in-chief of the army of Asia. The tastes of J., however, inclining him rather to civic pursuits, he declined this appointment, and remained attached to the court of Constantinople. In 521, he was named consul, and during the remaining years of the reign of his uncle, he continued to exercise great influence. In 527, the Emperor Justin, by the advice of the senate, proclaimed him his partner in the empire. Justin survived the step but a few months, and J. was crowned as sole emperor, along with his wife, the famous Theodora, whom, despite of her more than dubious antecedents as an actress, he had raised to the position of his wife. J.'s own accession, was in his 45th year. His reign, which extends over 38 years, is the most brilliant in the history of the late empire. Although himself without the taste or the capacity for military command, he had the fortune of being aided by the ablest generals of the last days of Roman military ascendency. Under the direction of his generals, and especially of the celebrated Narses (q. v.) and Belisarius (q. v.), his reign may be said to have restored the Roman Empire, at least in outward appearance, to its ancient limits, and to have reunited the East and West under a single rule. In his first war—that with Persia—he concluded a treaty by which the crisis that had so long threatened was at least warded off; but the rejoicings which celebrated its termination had almost proved fatal, by a domestic revolution, to the authority of J. himself. A conflict of the so-called Blue and Green factions in the circus in 532 was but an outburst of political discontent, which went so far as to elect a rival emperor, Hypatius. J. himself was struck with dismay, and had made preparations for flight; but the vigour and determination of Theodora arrested the rebels, and the revolt was suppressed. J. laid the tunnals, 30,000 victims having, it is said, fallen in a single day. By the army of Belisarius, the Vandal kingdom of Africa was re-annexed to the empire, and the general, completely with Narses, restored the imperial authority as well in Rome as in Northern Italy and a large portion of Spain. One of the most extraordinary, though in the end ineffective, works of the reign of J. was the vast line of fortifications which he constructed, or renewed and strengthened, along the eastern and south-eastern frontier of his empire. These works of defence, and the construction of many public buildings both in his capital and in other cities of the empire, involved an enormous expenditure, and the fiscal administration of J., in consequence, pressed heavily on the public resources; but it is admitted to have been able and uprightly conducted. It is, however, as a legislator that J. has gained renown. Immediately on his accession, he set himself to collect all previous legislative enactments which were still in force; and in order to do this thoroughly, he first compiled a code, which contained all the constitutions of his predecessors (527-529). See Codex. The authoritative commentaries of the jurists were next harmonised, and published under the title Digesta Pandecta (529-533). See Pandecta. The code was republished in 534, with the addition of J.'s own constitutions. His third great legal undertaking was the composition of a systematic treatise on the laws, for the guidance of students and lawyers. This was published a short time before the Digest, under the title of Institutes, i.e., Institutes. All these works were accomplished under the careful superintendence and direction of Tribonian, and were written originally in Latin. The latter treatises which J. caused to be written were in Greek, and were entitled Novella, i.e., 'New Works.'

The character of J. as a ruler contrasts favourably with that of most of the emperors, whether of the earlier or the later empire. His personal virtues were of a nature suited in a degree to hold the place of one of such station; and his public administration, with the single exception of that of ecclesiastical affairs, in which he was an arbitrary and imperious intermeddler, possessed great ability, and just and upright intentions. He died at the age of 68, in the 38th year of his reign, November 14, 565.

JUSTINUS, surnamed the Martyr and
frequently the philosopher, a father, and, after Tertullian, the most distinguished apologist of the Christian Church, was a native of Flavia Neapolis, a Roman city erected on the site of the ancient Sechem, in Samaria. The date of his birth is variously assigned to the years 89, 93, 114 a.D. His father Priscus was a heathen, and J. was educated in the religious of his father. He became an ardent student of the philosophy of his age, beginning with the school of the Stoics, but finally adhering to that of the Platonists. As his father himself relates, he was in the commencement highly satisfied; but, as he was one day wandering along the shore, he encountered a man of mild and venerable aspect, who, in reply to J.'s inquiries, gave him a doctrine of a higher knowledge than Plato had reached, referring him to the study of the Jewish prophets, and through them to the great Christian teacher whom they foretold. The result was his conversion to Christianity, at some date between 110 and 140 A.D. After his conversion, he retained the garb of a philosopher, but, as a Christian philosopher, he strove by his writings and his instructions to bring others to the truth which he himself discovered. His works, although not extant about the year 165, in the reign of Marcus Aurelius, because he refused to offer sacrifice to the heathen gods. His death is attributed to the ancients to the enmity and malignant arts of the Cynic philosopher Crescens. The works of J., although not very voluminous, are highly interesting and important. The books ascribed to him with certainty are two Apologies for the Christians, the first addressed to Antoninus Pius, the second to the senate, a Dialogue with Tryphon the Jew, which profess to be an account of an actual discussion held at Ephesus. The Address to the Greeks is not so certainly a genuine work of J., and the same may be said of his Exhortation to the Greeks, his Letter to Diognetus, and his work On the Monarchy of God, an argument against the polytheism of paganism. The other works ascribed to him are certainly spurious. The first edition of his works is that of Robert Stephens (Paris, 1531). The Beneficentiation edition of J. is that of Marcus Ottonis (Paris, 1742), and a recent edition has appeared in Germany by Professor Otto, 2 vols. 8vo (Jena, 1842—1844).

JUSTINUS I., or JUSTIN THE ELDER, Emperor of the East, was born in 450 A.D., of barbarian parents, and entered as a private into the emperor's body-guard, of which he rose to be commander. He held this last post till the death of Anastasius I., whom he succeeded on the throne, 518 A.D. Feeling that, from his total want of learning, he was unfitted to direct the internal civil administration, he wisely resigned this duty to the questor Proclus, whose administration gave general satisfaction. In 519, he entered into an arrangement with the pope, which resulted in a cessation of hostilities between the Greek and Latin churches. In 523, he resigned to Theodoric, king of Italy, the right—which till this time the eastern emperors had always exercised—of appointing consuls in Rome; and in the same year he became involved in a war with the king of Persia. In 525, occurred a terrible earthquake, which laid Edessa, Pompeipolis, Corinth, and Dyrrachium in ruins, and the ill-fated Aultsch was completely destroyed by fire and inundation combined. On hearing the news, J. took off his crown, put on mourning, and ordered a supply of money and necessaries for the unfortunate sufferers. Some time before his death, which took place in August 527, he had adopted his nephew Justinian, and associated him with himself in the government.

JUSTINUS II., or JUSTIN THE YOUNGER, Emperor of the East, succeeded his uncle, Justinian I., in 565 A.D., and espoused Sophia, the niece of the Empress Theodora, a beautiful and able, but revengeful woman. In order to ingratiate himself with the people, he immediately paid his predecessor's debts, and gave considerable largesses to the lower classes. His rule was weak and despicable, and though the empress was the de facto sovereign, she too often allowed her passions to blind her reason. Through her influence, Narses (q.v.) was dismissed from the exarchy of Ravenna, though at the time J. was fully aware that the Longobards were meditating an invasion of Italy. The joy of these savages, on hearing of the disgrace of the one man whom they dreaded, was excessive; and in 568 they burst like an avalanche upon Italy, which from this time was for ever lost to the Greek Empire. The emperor had better fortune towards the east and north; but though he had enough of able generals, such as Marcian, Tiberius, and Mauricius, yet the incompetent government found it impossible to raise a disciplined army, and was obliged to have recourse to the fatal expedient of employing mercenaries. Khoerh, king of Persia, took Dara after a long and gallant resistance, and followed up his success by conquering Mesopotamia and Syria. He was repeatedly driven back by Mauricius, but returned with redoubled fury. In the midst of this war, J. died, 20th September 578, after appointing Tiberius, one of his generals, as his successor. J. had been insane from 574, from which time till his death the supreme authority was in the hands of the empress.

JUTE is the fibre of an Indian plant, the Corchorus capsularis of botanists (see Corchorus), and another species, C. olitorius; the former, however, is the one from which the fibre is chiefly obtained. The fibre constitutes the inner bark, and is separated by maceration. It is sometimes obtained 12 feet long. Jute-fibre has become a very important part of the commerce of this and other countries, although its introduction to Europe for the first time is of comparatively recent date. Previous to 1830, it was scarcely known, except in the form of gunny-bags, in which sugar, rice, pepper, and other products of India had been constantly imported, without attracting attention to the material of which they were made. When the raw fibre was first introduced, its great length led to
the impression that it would be useful for cordage; subsequent trials, however, soon showed that its liability to injury from moisture made it useless for that purpose. But this capacity, such fabrics as matting and coarse carpeting soon became apparent, and a vast trade sprang up. Its employment for coarse bagging is immense; it is used for the cottons of India and America; all the sugar and rice, the pepper, ginger, cinnamon, gums, dye-stuffs, oil-seeds, and numerous other articles of Indian produce, reach us in gunny-bags, and almost every producing country either imports gunny-bags or justifies making them. In Great Britain, large quantities of gunny or jute bagging are manufactured at Dundee and other places; and it has the beneficial effect of relieving large quantities of hemp for the more important purposes of sail-cloth and cordage. Jute can be bleached only with difficulty, otherwise, the worn-out gunny-bags would furnish an abundance of paper material. Very much is employed, especially in India, for making inferior kinds of wrapping-paper. The imports of this article last year (1863) rose to the amount of a market in America for cotton-bagging, were less than usual, but in previous years they have reached as much as 50,000 tons. It is imported in bales, usually 25 cwt. each.

The cultivation of C. esculenta has been successfully attempted in England, a good crop of fibre being obtained; but the plants, although attaining 14 feet in height, did not ripen their seeds well.

JUTERBOGK, a small manufacturing town of Prussia, in the province of Brandenburg, is situated on the Nile, 27 miles south of Potsdam. Here considerable wool and flax markets are held, and wine is produced to some extent. Woollen-cloth manufactories, spinning, weaving, and dyeing are also carried on. Pep. 6257. In the vicinity is the field of Dennewitz, where the Prussians defeated the French under Ney and Oudinot, September 6, 1813.

JUTLAND (Dan. Jylland), the only considerable peninsula of Europe that points directly north, forms a portion of the kingdom of Denmark, and comprises the province of North Jutland and the duchy of Slesvig (q.v.), which has been called by the Danes South Jutland. The province of North Jutland has an area of 9670 square miles, and a population (1860) of 706,833. See DENMARK. J. is said to have been inhabited in the earliest times by the Cimbri (q.v.), and from this circumstance it has received the name of the Cimbrian Peninsula, or Chersonesus. In historical times, we find it inhabited by the Jutes, who took part in the expedition of the Saxons to England. As allies of the Jutians, they waged war with Charlemagne, and under the name of Normans (Northmen), frequently desolated the coast of Germany and France.

JUVENALIS, Decimus Junius, the Roman satirist, was born at the Volcanic town of Aquinum. The year (138 a.d.) of his birth is not known with certainty, but it may be taken for granted that he was a youth in the reign of Nero; that he came to man's estate, and was writing in that of Domitian (81—96 a.d.); and that he retired into the times of Hadrian (117—138 a.d.). He seems to have enjoyed a competence. He practised at Rome as an advocate; and there are some reasons for supposing that he visited Egypt. Among his friends were Martial and Statius, and perhaps Quintilian. But nothing is known of his personal history except a few leading facts—among them, that he recited some of his satires in public with much applause; and even these facts are not known to us in any detail. His interest for posterity depends altogether on his writings—on his sixteen satires, still surviving, which occupy the very first rank in satirical literature, and are of priceless value as pictures of the Roman life of the Enieure. And Horace respectively represent the two schools into which satire has always been divided; and from one or other of them every classical satirist of modern times has borrowed the models of his art. The first of the two is the satirist of ridicule, so J. is the satirist of indignation. J. is not a man of the world so much as a reformer, and he plays in Roman literature a part corresponding to that of the prophets under the Jewish dispensation. He uses satire not as a branch of comedy, which it was to Horace, but as an engine for attacking the brutality of tyranny, the corruptions of life and taste, the crimes, the follies, and the frenzies of a degenerate state of society. His best, and most impertinent of a scurrilous, asp, but singularly pungent kind, and many noble flashes of a high moral poetry. We would especially point out that the old Roman genius—as distinct from the more cosmopolitan kind of talent formed by Greek culture—is the part of which the ancients may have been better translated in our literature than almost any other of the ancients. Dryden's version of five of his satires are amongst the best things Dryden ever did. Dr. Johnson imitated two of the most famous in his London and Variety of Human Wiles; and the version of the whole of them by Gifford is full of power and character. The best modern edition of J. is that of Ruperti, and there are good recent English ones by Maclean and Mayor.

JUVENILE OFFENDERS. The practice of singling out offenders of a tender age from adult offenders, and subjecting them to different punishment and reformatory treatment, has gained ground of late years. In the eye of the law, persons are capable of committing crime when of the age of seven, and are punishable like other persons. But in England and Ireland, in cases of larceny, whenever a person under the age of 16 is brought before justices, and is convicted, he or she may be committed to the house of correction, and may remain in the house for a whole year, though only 14 days months or less, or, in the discretion of the justices, shall be fined £3 or less; or if a male under 14 years, shall be once privately whipped (with a birch rod, not more than 12 strokes), either instead of or in addition to such imprisonment. The juvenile offender, however, may object to be tried by justices of the peace, and may insist upon being tried by jury, if he prefer it. And in all cases of juveniles under 16 being convicted of offences, the justice or magistrate may, in addition to the sentence then passed, provided such sentence is not less than 14 days' imprisonment, direct the offender, at its expiration, to be sent to a reformatory school for a period of not less than two years, and not more than five years; but it may be taken for granted that he was youth in the reign of Nero; that he was at man's estate, and was writing in that of Domitian (81—96 a.d.); and that he retired into the times of Hadrian (117—138 a.d.). He seems to have enjoyed a competence. He practised at Rome as an advocate; and there are some reasons for supposing that he visited Egypt. Among his friends were Martial and Statius, and perhaps Quintilian. But nothing is known of his personal history except a few leading facts—among them, that he recited some of his satires in public with much applause; and even these facts are not known to us in any detail. His interest for
K

The eleventh letter of the English alphabet. The Semitic languages had two characters with the same sound or very similar consonantal power—the one called in Hebrew Kaph (hollow of the hand), the other Kaph (the hind head). Both were at first transplanted into the Greek [κ (Kappa) = K, Κ (old Greek Kappa) = Q], and thence into Latin; but in Greek, Kappa, or q, was easily dropped, and in Latin, Kappa, or k, was supplanted by c (see Alphabet, and letter C), except in the case of a few words, as Kalantar and Kama. In the languages derived from Latin, accordingly, k is used only in writing foreign words. Although unknown to the Anglo-Saxon alphabet, it has in modern English to a considerable extent taken the place of c in words of Saxon origin. See C. The character Kappa, or q, has been retained in modern alphabets, as it was in Latin, only in the combination qu. This is clearly a relic of the primitive nature of written characters, when they constituted syllabaries rather than alphabets; each character expressing a consonantal articulation followed by a particular vowel sound; so that there was one character for ba, and another for be; one for ke, and another for ko or ka, as in highgloss. K (q, or c h) is a sharp mute, of the guttural series, k, g, ch, gh. See Letters. The interchanges of k are indicated under C.

Kaa Ba (Arab. 'square house'), the name of an oblong stone building within the great mosque of Mecca (q.v.). According to the legend, Adam first worshipped on this spot, after his expulsion from Paradise, in a tent sent down from heaven for this purpose. Seth substituted for the tent a structure of clay and stone, which was, however, destroyed by the Deluge, but afterwards rebuilt by Abraham and Ishmael. Certain it is that the building existed from time immemorial, and served the Arabs before Mohammed as a place of idolatrous worship, probably to Zohal (Saturn). It is, as it now stands—rebuilt in 1627—35 to 40 feet high, 18 paces long, 14 broad. Its door, coated with silver, is opened only three times in the year—one for men, once for women, and once for the purpose of cleaning the interior. Next to this door, in the north-east corner of the edifice, is set the famous lava-like Black Stone which, since the second year of the Hidjrah (q.v.), has served as Kibbeh, i.e., as an indicator of the direction towards which all Moslems must turn in their prayers. This stone, which is said to have dropped from paradise together with Adam, is held in extreme veneration, and one of its principal names is 'The Right Hand of God on Earth.' It was originally of white colour, but the sins of mankind have caused it to shed so many silent tears, that it has become (externally) quite black. Others explain this change of colour by the unnumbered kisses and touches bestowed upon it by the pilgrims, part of whose ceremonies (see Haaj) consists in compassing the K. seven times, each time either kissing this stone, or touching it with the hand, and kissing the latter. A smaller stone, to which, however, less veneration is shown, is set in the south-east corner of the Kaaba. The outside of the K. is annually covered anew with the richest black silks, on which are embroidered sentences from the Koran in gold; a pious contribution first on the part of the califs, later of the sultans of Egypt, now of the Turkish emperors. The K. has a double roof, supported by pillars of alabaster, and it is said that no bird ever rests upon it. The whole edifice is surrounded by an enclosure of columns, outside which there are found three oratories, or places of devotion, for different sects; also the edifice containing the well Zem-Zem, the cupola of Abbas, and the Treasury. All these are further enclosed by a splendid colonnade, surmounted by cupolas, steeples, spires, crescents, all gilded and adorned with lamps, which shed a brilliant lustre at night. These surroundings, between which and the K. run seven paved causeways, were first devised by Omar, for the better preservation of the K. itself.

KAA MA, or CAAMA (Antilope Camaa), a species of antelope, a native of the south of Africa, nearly allied to the Bubalus (q.v.) of the north of Africa. It is the Harte-beest of the Dutch colonists of the Cape of Good Hope, where it is the most common of all the large antelopes. Its horns are rather short and thick, curved like the sides of a lyre. It inhabits plains, and congregates in large herds. Its flesh is very good, more resembling beef than that of almost any other antelope. It is very capable of domestication.

KABA NAGY, a small town of Hungary, situated in a plain 20 miles south-west of Debreczin. Pop. 6000.

KABYLES, another name for the Berbers (q.v.).

KAFFA, a fortified town and seaport of South Russia, in the government of Taurida, is picturesquely situated on the east coast of the Crimea, 70 miles east of Simferopol. The harbour, a portion of the bay of K., an inlet of the Black Sea, is deep and safe. It contains a citadel, a barracks, and a museum of antiquities chiefly collected in the vicinity; and although it has greatly declined, it is still the seat of considerable trade. The principal exports are wheat, hides, sackcloth, and goats' hair. In 1859, 213 vessels of 42,194 tons entered and cleared the port. Pop. 8500.

K., the ancient Theodotia or Feodoria, was in the 13th c., when it was under the Genoese dominion, the centre of trade. In 1463, it fell into the hands of the Turks, under whom it had 100,000 inhabitants. In 1783, it was taken by the Russians, to whom it was ceded by the treaty of Jassy in 1792.

KAFFIR, or KAFIR, the name of a great family of the human race inhabiting the south part of the continent of Africa, classed by Dr Latham in division B of the variety Atlantide, their
physical conformation being modified negro, and which also includes the Betjans (q.v.), Ovampos, Damaras, and other similar tribes living in the region of the northeast coast, and extending to the boundaries of the Cape Colony. By the term K., however, the tribes inhabiting the coast-country on the east side of South Africa are generally understood, and recent events have further modified this designation in a peculiar sense as more particularly applying to the tribes living in the country between the Cape Colony and Natal, those of the latter colony, as far north as Delagoa, being now better known as Zulus or Zulu Kaffirs. General distribution of the K. races: 1. T. 1744. (Amatabele, Amazulu, &c., north of Natal; Amampando, Amamossa, &c., in Kaffraria Proper) speaking the Zulu language and its dialects, inhabiting the east-coast region; 2. Tribes (Makolodo, north, and Bakukun, north-west of Lake Ngami; Bakalhari, &c.) speaking the Sichuana language and its dialects, inhabiting the central region, and known under the general name of Betjans; 3. Tribes (Ovampos and Damaras) speaking the Ovambo or Otjiherero and its dialects, inhabiting west-coast region.

History, &c.—The word K. is derived from the Arabic Kafir, 'an unbeliever,' which was applied by the Mohammedan inhabitants of the east coast to the native tribes living south of them and adopted by the Portuguese, after their settlements at Melinda and Mozambique, to designate the inhabitants of the vast region lying to the south, and extending to the country of the Hottentots, now the republic of Cape Colony.

The oldest genealogical records of the K. chiefs go back to 1617. In 1688, the old Dutch colonial first record mentions the Kaffirs as having at that early period driven the Hottentot aborigines and inhabited the extensive plains south of them and adopted by the Portuguese, after their settlements at Melinda and Mozambique, to designate the inhabitants of the vast region lying to the south, and extending to the country of the Hottentots, now the republic of Cape Colony.

clubs, but the use of firearms is now prevalent amongst all the South-African tribes; and in the late war, the K. warriors, in skirmishing, excited the admiration of the light Company. The Kaffraria and the Natal, as the population is rapidly decreasing, and the chiefs fast losing their prestige and influence. The paramount chief is Rili, or Credi, of the Amagaleka tribe, who has his principal kraal about 20 miles east of the Great Kei River.

The soil of the Kaffer-like regions is very fertile. The maize, rice, or Indian corn, pumpkins, &c., for their own use. Cotton has been successfully grown in many localities along the coast. Cattle, horses, and goats thrive well, and a considerable trade is carried on for the adjacent colonies. The cultivation is carried on in hedges, huts, goat-skins, tallow, and wagon-wood. The Wesleyan Society has established many well-organised stations, forming convenient halting-places along the lines of road which traverse Kaffraria between the Cape Colony and Natal, and where travellers will be sure to meet a kind reception.

KAFFIRIA, British, a country of South Africa, between the Great Kei, the White Kei, the Keiskamma, and Indian Ocean (wrested from the Kaffirs by the Cape colony from 1846—1847), forms what is now the independent colony of British Kaffiria. It has an area of 4000 square miles, and is bounded on the north by a well-watered river, running parallel to the coast, and on the south by the Indian Ocean. It contains a population of from 8000 to 10,000 souls of British and German descent, and probably 100,000 of the native races, Amuxosa and Amafengu Kaffirs. The physical aspect of British K. is similar to that of Lower Natal, and the east-coast region of the Cape Colony. Many fertile, well-watered valleys are found amongst the spurs of the Amatola Mountains. Behind these mountains are high grassy plateaux, extending to the Kei River, and well adapted both for grazing and agriculture.

In 1859, British K. was divided into towns of from 1000 to 3000 acres, which were granted free on certain terms of settlement and defence; and it now contains a population of from 8000 to 10,000 souls of British and German descent, and probably 100,000 of the native races, Amuxosa and Amafengu Kaffirs. The principal town is King William's Town, the head-quarters of the military and civil government, and capital of the population and administrative centre of the colony. The port of British K. is East London, at the mouth of the Buffalo River, where there is good anchorage. There are numerous military posts and German villages extending along the line of the Buffalo from the sea to the mountains, and also several mission-stations, Episcopal, Wesleyan, Presbyterian, and German; and the natives are in numerous cases reclaimed from heathenism, and becoming an orderly and civilised population. In 1861, by her Majesty's letters-patent, British K. was declared an independent colony, under a lieutenant-governor, the governor of the Cape being styled High Commissioner. Its revenues are derived from the quit-rents of the land granted, duties collected at the port of East London, and are at present about sufficient to pay the expenses of the limited executive.

The larger fere natura have nearly disappeared, although a few years back the high plains north of the Amatola, called the Bontebok Flat, were the favourite hunting-grounds of South African sportsmen. A considerable number of the German Legion, sent here after the Crimean war, have received grants of land, and make excellent settlers.
KAFIRISTAN—KALIDASA.

English, and one or two German newspapers are published in King William's Town.

(While this is going to press, it is announced that British K. is to be annexed to Cape Colony.)

KAFIRISTAN (i.e., country of the Kafirs or Inbiles), a country of Central Asia, on the south declivity of the Hindu Kush, forming part of the northern basin of the Cabul, in 35°—36° N. lat. and 69° 29'—71° 20' E. long.; area, 7000 square miles. The country is divided into narrow valleys by spurs of the Hindu Kush. The inhabitants, whose number is unknown, differ, as the name of the country implies, in creed and origin from the great body of the neighbouring tribes; in features and complexion, they claim kindred with Europeans. Their language, too, is said to be wholly independent of the other dialects of Central Asia. This state of isolation is mainly owing to the natural strength of the region, which, though repeatedly invaded, has never yet been subdued. The soil is fertile enough to render external intercourse comparatively unnecessary, yielding, as it does, fruits, wheat, and millet, and feeding large herds of cattle, sheep, and goats. Metals and timber likewise abound, the people working in the same with considerable skill.

KAFTAN, an article of Turkish dress, resembling a dressing-gown, which is in use also amongst other oriental nations.

KAISARIYEH. See CASSABIL.

KAISERSLAUTERN, or LAUTERN, a small town of Rhenish Bavaria, is pleasantly situated on the left bank of the river Rhine, 20 miles north-west of Landen. Pop. about 6700.

KAKODYL. See CACODYL.

KALAMAZOO', a city of Michigan, United States, is situated in the south-west portion of the state, on the west bank of the river of the same name, 56 miles from its mouth, and 143 miles west of Detroit, on the Michigan Central Railway. It has a state lunatic asylum, a college for both sexes, ten churches, two newspapers, and several manufactories. Pop. in 1860, 6070.

KALE, or CALÉB, a town of Pressian Saxony, in the government of Magdeburg, is situated 18 miles south of the town of that name, on the left bank of the Saale. Spinning and weaving, with manufacturers of paper, tobacco, and sugar, are here carried on. Pop. 6863.

KALÉB, or BENEDECOLE (Ger. Kohl), a cultivated variety of Brassica oleracea, differing from Cabbage in the open heads of leaves, which are used for culinary purposes as greens, and also as food for cattle. There are many sub-varieties, of which some are smooth-leaved, and others of a reddish-brown or purplish colour; some have the leaves comparatively plain, and others have them very much waved or curled, some also fringed or lacinated. Most of the kims are biennial, like the cabbage, but some may be reckoned perennial, as the Milan Koh (Clam de Milan), and are frequently propagated by cuttings. The kind called German Greens is one of the most delicate, and is very much cultivated in Britain, chiefly as a winter vegetable. The more the leaves are curled the more esteemed. The mode of its cultivation nearly agrees with that of cabbage.

KALE, SEA. See SEA KALE.

KALIDOSCOPE (from Gr. kaios, beautiful, eldest, image, and skopein, I see), an optical instrument invented by Sir David Brewster in 1817. It consists of a tube, through whose whole length pass two mirrors or reflecting planes, which are hinged together along one edge, and make with each other an angle which is an aliquot part of 180°, whilst the one end is fitted up with an eyeglass, and the other is closed by two glasses, at a small distance from each other, between which are fixed fragments of glass or other variously coloured objects. The eye looking into the tube now perceives these objects multiplied as many times as the angle which the reflecting planes make with each other is contained in the whole circumference of a circle, and always symmetrically disposed; and the slightest shaking of the instrument produces new figures. There are various modifications of the kalidoscope, by which its power is much increased; and it is not only a pleasing toy, but of great use to pattern-drawers and others, to whom it supplies endless varieties of figures.

KALENDAR. See CALENDAR.

KALENDS. See CALENDERS.

KALEWALA. See FINNISH LITERATURE.

KALEUFE, or KOLGUVE, an island of Russia, in the Arctic Ocean, 240 miles in circumference, belongs to the government of Archangel, and is situated 113 miles east of the northern extremity of the peninsula of Kanin. It is the resort of innumerable flocks of wild-fowl, especially eider-ducks, geese, and swans, which are caught in great numbers by the fowlers who visit the island every summer.

KALIDASA, the greatest dramatist, and one of the most celebrated poets of India. He is known to the literary public of Europe especially through his drama Śākuntalā, which, first introduced to the notice of the western world by Sir William Jones (1759), has since been translated into many languages of Europe, that the early success obtained by Sanscrit studies in England and Germany may be considered due to this master-piece of Sanscrit literature. Among all the different poets, and of the same poet, and of the same play,当事人 known to Śākuntalā, is the Vikramorvaḍa, or the Hero and the Nymph. Besides these works, Hindu tradition ascribes to his authorship a third drama and several poems, which no European critic will believe could ever have sprung from a mind like that of Kālidāsa. Professor Lassen, in the Indische Alterthumskunde, passes the following judgment on this poet: 'Kālidāsa may be considered as the brightest star in the firmament of Hindu artificial poetry. He deserves this praise on account of the mastery with which he wielded the language, and on account of the consummate tact with which he imparted to it a more simple or more artificial form, according to the require ment of the subject treated by him, without falling into the artificial diction of later poets, or over steering the limits of good taste; on account of the variety of his creations, his ingenious conceptions, and his happy choice of subjects; and not less on account of the complete manner in which he attended to his poetical ends, the beauty of his narrative, the delicacy of his sentiment, and the fertility of his imagination.' But although we are enabled by his works to appreciate the merit of this poet,
KALIYUGA, in Hindu chronology, the fourth or last of the periods contained in a Mahâyuga or great Yuga (q. v.). It may be compared to the Iron Age of classico-mythological mythology. It consists, according to native imagination, of 432,000 solar-sidereal years, and begins 3102 years before the Christian era.

The relation of the four Yugas being marked by a successive physical and moral decrement of created beings, the Kaliyuga is the time when the gods will withdraw. In the last Krita (or first) age, Manu says, 'the (genius of) Truth and Right (in the form of a bull) stands firm on his four feet, nor does any advantage accrue to men from iniquity. But in the following ages, by reason of unjust gains, he is deprived successively of one foot; and even just emoluments, through the prevalence of theft, falsehood, and fraud, are gradually diminished by one foot (i.e., by a fourth part). The estimate in which this Kaliyuga, our present age, is held by the modern Hindus may be gathered from one of their most celebrated Purânas, the Padma-Purâna. In the last chapter of the Kâryâ-âgâra of this Purâna, the following account is given of it: In the Kaliyuga, the genius of Right will have but one foot; every one will dwell in evil. The four castes will be devoted to wickedness, and deprived of the nourishment which is fit for them. The Brahmans will neglect the Vedas, hanker after presents, be lustful and cruel. They will despise the scriptures, gamble, steal, and desire intercourse with women. For the sake of a livelihood, some Brahmans will become arrant rogues.

The Shâtras will endeavour to lead the life of the Brahmanas; and out of friendship, people will bear false witness. . . . For the sake of a livelihood, some Brahmans will become arrant rogues.

. . . . The Shâstras will endeavour to lead the life of the Brahmanas; and out of friendship, people will bear false witness . . . . they will injure the wives of others, and their speech will be that of falsehood. Greedily of the wealth of others, they will entertain a guest according to the best of the scriptures, but afterwards cheat him out of covenanted fees; they are indeed worthy of hell.

The twice-born (i.e., the first three castes) will live upon debts, sell the produce of cows, and even their daughters. In this Yuga, men will sleep under the shade of trees; women will be excessively fickle. . . . In the Kaliyuga, the earth will bear but little corn; the clouds will shed but little rain, and that, too, out of season. The cows will feed on ordure, and give little milk, and the milk will lack no blemish; there is no doubt of that. . . . Trees, even, will wither in twelve years, and the age of mankind will not exceed sixteen years; people, moreover, will become gray-haired in their youth; women will bear children in the fifth or sixth month: men will become troubled with a great number of children. In the Kaliyuga, the foreigners will become kings, bent upon evil; and those living in foreign countries will be all of one caste, and out of lust take to themselves many wives. In the first twilight of the Kaliyuga, people will disregard Vishnu; and in the middle of it, no one will even mention his name.

KALMAR, a town and seaport on the south-east coast of Sweden, capital of a len or state of the same name, is situated on the shores of Lake Vättern and the Oland, and about 200 miles south-south-west of Stockholm. It has a good harbour, a handsome cathedral, and a large and beautiful castle, in which, on the 12th July 1367, the treaty called the 'Union of Kalmar,' which settled the succession to the three northern kingdoms upon Queen Margaret of Denmark and her heirs for ever, was agreed to by the deputies of the three kingdoms. The union, nevertheless, lasted only till the death of Margaret (see DENMARK, HISTORY OF). The commerce of the town is considerable, and manufactures of sugar and tobacco are carried on. Pop. 7554.

KALMIA, a genus of plants of the natural order Ericoæ, consisting of evergreen shrubs, mostly about two or three feet high, natives of North America, and with red, pink, or white flowers, generally in corymbs. The flowers are very delicate and beautiful, and the corolla is in the shape of a wide and shallow bell. Some of the species are frequent ornaments of gardens in Britain. They delight in a peat soil. K. latifolia of the Mountain Laurel, or Galloës, Bœuf of North America, occupies large tracts on the Alleghany Mountains. It grows to the height of ten feet, and the wood is very hard. It is narcotic and dangerous; the leaves are poisonous to many animals, and the honey of the flowers possesses noxious
KALMUCKS—KAMA.

properties. A decoction of the leaves has been used with conspicuous success in certain classes.

KALMUCKS, or, as they call themselves, the Derben-Ujrat (the Four Relatíves), and also designated by the name of Eleutes and Khailnik (Apostates), are the most numerous and celebrated of the Mongol nations. They are divided into four tribes, the first of which, the Khakda (Warriors), number nearly 60,000 families, and inhabit the country around the Koko-nur, which they consider the native country of the race. One portion of this tribe migrated to the banks of the Irtysh, and became subsequently incorporated with the second tribe, the Dzangars; another portion migrated to the banks of the Volga, in the 17th c., and is found at the present day in the government of Astrahan. The second tribe are the Dzangars, who give the name to a large territory (Dzungaria) in the west of Chinese Tartary; at the present day they number about 20,000 families. The third tribe are the Derba or Tchoros, who deserted Dzungaria, and, finally, to the number of 15,000 families, removed a few years ago to the plains of the Ili and the Don, where they are being gradually incorporated with the Don Cossacks. The fourth great tribe of the K. are the Torpols, who, about 1699, separated from the Dzangars, and settled along the Volga, whence they were called the K. of the Volga; but finding the Russian rule too severe, the majority returned to Dzungaria.

No Mongol or Turkish race presents such characteristic traits as the K. exhibit, they answer exactly to the description given of them by Jornandes 13 centuries ago, when, under the name of Huns, they devastated Southern Europe. The Kalmuck is short in stature, with broad shoulders, and a large head; his body is covered with coarse, long hair, his eyes being to half-shut, and slanting downwards towards the nose, which is flat, with wide nostrils; the hair is black, coarse, and straight, and the complexion deeply swarthy. The Kalmuck is considered to be the original type of the Mongol and Manchó races, and his ugliness is the index of the purity of his descent. They are a nomad, predatory, and warlike race, and pass the greater part of their lives in the saddle. Their usual food is barley-flour soaked with water, and their drink is the 'koumiss' (made from fermented mare's milk). In 1829, Russia established a Kalmuck institute for the training of interpreters and government officials for the K. of Russia, and she has since been making great efforts to introduce civilization amongst them. Many still retain their native Buddhism.

KALOCSA, a town of Hungary, near the left bank of the Danube, about 70 miles south of Pesth. It contains a fortified bishop's palace, with a library of 200,000 volumes. It is a steam-packet station on the Danube, and contains a population of 11,400.

KALONG, one name originally Javanese, and belonging to one or more species of frugivorous Bat (q. v.) inhabiting Java, but now frequently applied to all the frugivorous bats, the family Pteropidae, or at least to all the species of the genus Pteropus. The Pteropidae are all large bats, and some of them are the largest of all the Cheiroptera. They are called Rouxette by French naturalists, and often, popularly, Flying Fox by Europeans in the East. They are found in the East Indies, Japan, Australia, and South America. There are many species. Their food consists chiefly of soft fruits, as bananas, figs, &c. The Javanese K. (Pteropus javanicus) measures about 5 ft. in the outside of the wing. The head and body are more than a foot long. It is crepuscular, and during the day, great numbers may be seen hanging by their hinder claws, motionless and silent, on the branches of trees which they have selected as their abode. The hair is downy, and of a reddish-brown colour. This and the other true Pteropus have no tail, and a smaller number of vertebrae—24 in all,—than any other mammalia. Some of the Pteropidae have a very short tail. The name of some of them is eaten, and one, inhabiting the Moluccas and Ilands of Sunda, has been called the Eatable Kalong (P. edulis). It is said to be white and delicate. Some of the species are migratory.

KALPA, in Hindu Chronology, a day and night of Brahma, which, according to some, is a period of 4,320,000,000 solar-external years, or 2,452,144,000,000 human years, measuring the duration of the world, and as many, the interval of its annihilation. The Brihadysa-Varan's admits of an infinity of kalpas; other Puranas enumerate thirty. A great kalpa comprises not a day, but a life of Brahma.—In Vedic literature, kalpa is a Veilanga. See KALPA-STRA.

KALPA-SUTRA is, in Vedic Literature, the name of those Sancrít works which treat of the ceremonial referring to the performance of a Petic sacrifice. See VEDA.—In Jaina Literature, it is the name of the most sacred religious work of the Jainas, called the Kalpasutras. It is chiefly supposed with the legendary history of Mahavira, the last of their 24 deified saints, or Tirthankaras, but contains also an account of other four saints of the same class. The name of the author was Bhadra Bahu, and the work was composed, as Stevenson assumes, in the year 411 of the Christian era; but the conjecture of another writer places it 632 after Christ. It is held in so high respect with the Jainas, that, of the eight days in the middle of the rains which are devoted to the reading of those works esteemed particularly sacred, no less than three are allotted to the Kalpa-Sutra. Stevenson, The Kalpa-Sutra and Navaj Tetura (Loek. 1848).

KALUGA, a government of Russia, lies immediately south-east of that of Smolensk. Area, 11,750 square miles; pop. 1,006,400. The surface is flat; the soil, stony, sandy, and only moderately fertile. More than half of the province is under forest. It is watered by numerous rivers, the chief of which is the Oka. The principal occupation of the inhabitants is the cultivation of hemp. Sackcloth, which is not only sent to the ports of Russia and Europe, but also largely exported to America, is the chief article of manufacture. Coloured cloths for the railway trade are manufactured here. The government of K. is divided into eleven districts.

KALUGA, chief town of the government of the same name, is situated on the right bank of the Oka, in lat. 54° 31' N., long. 36° 20' E. From the 14th to the 18th c., its stronghold was a great protection against the invasions of the Lithuanians, the Tartars of the Great Horde, and especially against the Crimean Tartars. Situated in the centre of the empire and on a navigable river, it carries on an extensive corn-trade, the corn being sent down the Oka to Nijin-Novgorod, and thence up the Volga, the Volga canals, and the Neva, to St Petersburg and the Baltic ports. The value of the branch of trade is 22,000,000 rubles (£3,300,000). There are several leather and other factories in the town. Pop. 32,335. K. has for many years been a place of banishment for political offenders; and is at present the residence of Schamyl, the Circassian chief.

K'AMA, a navigable river of European Russia, the principal stream of the government of Viatska, and after a south-west course of 1100 miles, joins the Volga in the government of Kasan, 50 miles above the town of that name. In
chief tributaries are the Viatka, the Tchoussovaia, and the Bielaja. This river is navigable 40 miles below its source, and the navigation commences in the beginning of May. The annual value of the trade of the K. is estimated at 2,000,000. The river abounds in fish, especially salmon.

KAMA, or KAMADEVIA, the Hindu god of Love, and one of the most pleasing creations of Hindu fiction. In Sanscrit poetry, especially that of a later period, he is the favourite theme of description and allusions; and mythology exalts his power so much, that it allows of the goddess of love being succumbed to it. According to some Puranas, he was originally a son of Brahma; according to others, a son of Dharma (the genius of Virtue), by S'raddhä (the genius of Faith), herself a daughter of Daksha, whose sister she was, fancied by him.

The god Śiva being on one occasion greatly incensed at K., reduced him to ashes; but ultimately, moved by the affliction of Rati (Voluptuousness), the wife of K., he promised her that her husband should be reborn as a son of K'rṣna. The god K'rṣna, accordingly, having married Rukmini, bore him Pradýumna, who was the god of Love. But when the infant was six days old, it was stolen from the lying-in chamber by the terrible demon S'anbara; for the latter foreknew the prophecy that Pradýumna, if he lived, would be his destroyer. The boy was thrown into the ocean, and swallowed by a large fish. Yet he did not die; for that fish was caught by fishermen, and delivered to Māyāvati, the mistress of S'anbara's household, and when it was cut open, the child was taken from it. Whilst Māyāvati wondered who this could be, the divine sage, Nārada, satisfied her curiosity, and counselled her to rear tenderly this offspring of K'rṣna. She acted as he advised her; and when Pradýumna grew up, and learned his own history, he slew the demon S'anbara. Māyāvati, however, was later apprised by K'rṣna that she was not the wife of S'anbara, as she had fancied herself; but that of Pradýumna, in fact, another form of Rati, who was the wife of K. in his prior existence.— K. is described or represented as holding in his hands a bow made of sugar-cane, and strung with bees, besides five arrows, each tipped with the blossom of a flower which is supposed to conquer one of the senses. His standard is agreedly to the legend above mentioned, a fabulous fish, called Makara; and he rides on a parrot or sparrow—the symbol of voluptuousness. His dress, an easy coat of satiny cloth, is easily accounted for from the circumstances named, and from the effects of love on the mind and senses. Thus, he is called Makaravatūpoja, 'the one who has Makara in his banner;' Māda, 'the masken,' &c. His wife, as before stated, is Rati; she is also called Pradýumni, 'a portion of Kāma, or Priti, affection.' His daughter is Trijāth, 'thirst or desire;' and his son is Aniruddha, 'the unrestrained.'

KAMNETZ-PODOĽSK, or PODOĽSK, a town of West Russia, capital of the government of Čodola, is picturesquely situated near the Austrian frontier, on a steep rock above the river Smotritza, an affluent of the Dniester. Its foundation dates from the earliest times. Pop. 19,579. The most noteworthy buildings are the Gothic Cathedral and the Dominican Church. The fortifications, which were razed in 1812, have been renewed. K. was, before the partition of Poland, the strongest bulwark of that country against the Turks.

KAMPEN, one of the prettiest towns of the Netherlands, in the province of Overstreeks, is situated near the mouth of the Yssel, in the Zuyder Zee. Here a bridge 790 feet long, and upwards of 20 feet broad, extends across the river. Though formerly of greater importance, it still carries on a considerable general trade. Top. 12,316.

KAMPTULICON, the name given to a newly invented floor-cloth, which is said to be made of India-rubber and cork; much of it, however, consists of oxidised linseed oil and cork. The cork is reduced to a state resembling very fine dust, and kneaded up with the real caoutchouc, or with the artificial kind made of oxidised linseed oil, the whole being kept very soft by heat. The mass is then made into sheets by passing through cylinder rollers heated with steam. The sheets, when cold, are ready for use, when no ornamental surface is required; but very excellent designs may be painted upon it, the same as upon ordinary floor-cloth. Kamptulican, notwithstanding the ease with which it is made, is more expensive than the floor-cloth made by painting hempen or linen fabrics; it has, however, qualities which render it very valuable for special purposes; its elasticity to the tread not only makes it agreeable to support, but is noiseless, and is consequently well adapted for hospital passages and other positions in which quiet is desirable; it is also impervious to damp, and thereby well suited to damp stone floors where other fabrics would soon decay.

KAMCHATKA, PENINSULA OF, forms the south-east extremity of Siberia, from which it stretches southward, extending in lat. between 51° and 60° N., and in long. between 153° 40' and 164° 20' E. It is 725 miles long, and averages 199 miles in breadth. A chain of volcanic mountains runs from the centre of the peninsula, and gives rise to the rivers, of which the Kamchatka is 150 miles in length. There are about 14 volcanoes in the peninsula, the most remarkable of which is the volcano of Plutcheyvsk—is 16,000 feet high. This mountain now only emits smokes and embers; but in former times, eruptions used to take place every seven or eight years. The soil, in general, is stony; but there are many tracts of mountain slope which are arable. Agriculture, however, is much hindered by untimely frosts, peripatetic rains, and sometimes by multitudes of mice and rats. The bread required by the inhabitants of the fortresses of Petropavlovsk and Tagil is supplied from Okhotak. The principal occupations of the inhabitants are fishing and hunting. The most valuable domestic animal is a peculiar kind of dog which never barks. K. was annexed to Russia at the end of the 17th c., after the expedition of the Russian chieftain Titov, and was first named after the name of the chieftain Kamtchadal, Konotleri, Omonotomi, and Russians. The Kamtchadales—the preponderating race of the inhabitants—live mostly in the south. They are small in stature, with a large head, broad face, black hair, small eyes, broad shoulders, and hanging lips and stomach. Formerly, they lived in tents made of branches; they now dwell in huts. They have nominally embraced Christianity, but retain much of their old superstitions. Nijii-Kamtchadals, the chief town of the government, is situated on the river Kamchatka. The fort of Petropavlovsk, with a fine harbour covered with ice only during a brief period of the year, is most picturesquely situated, and enjoys a healthful climate.

KAMYSHIN, a town of Russia, in the government of Saratov, 120 miles below the town of that name, on the right bank of the Volga, lat. 50° 5' N., long. 43° 25' E. It possesses about 7500 inhabitants, who carry on a considerable general trade. Top. 10,760.

KANAGAWA, a town of Japan, and the shipping port of Yedo. It was opened (together with Hakodali and Nagasaki) to British subjects on the 1st July 1859 by the treaty of August 1858.
KANARIS—KANGAROO.

It is situated on the northern edge of a bight on the western side of the great bay of Yeddo, and about 16 miles from that city. Here is located the central section of the small foreign community, which, through the manoeuvres of the Japanese, has been established—not at K., but at Yokohama—on the opposite point of the bay, and in a more isolated situation. K. has a larger foreign trade than any other port of Japan. In 1861, its foreign trade was worth nearly a million sterling—the imports amounting to £397,381 and the exports to £589,948, and it gave employment to about 100 vessels.

KANARIS, Konstantin, a native of the isle of Ipsara, distinguished for his exploits in the Grecian war of independence, and particularly for the destruction of Turkish vessels by fireships. He was master of a small merchant-vessel before the commencement of the war. In 1822, he blew up the Turkish admiral's ship in the Strait of Chios, and thus avenged the cruelties which the Turks had perpetrated on the Greeks in that island. In November of the same year, he burned the Turkish admiral's ship in the harbour of Tenedos. His native isle of Ipsara having been ravaged, he took revenge, on 17th August 1824, by burning a large Turkish frigate and some transport-ships which were carrying troops to Samos, and thereby saved Samos from the calumny which Chios and Ipsara had endured. In 1825, he formed the bold design of burning the Egyptian fleet in the harbour of Alexandria, where it lay ready to carry troops to the Peloponnese, and it appears that only an unfavourable wind prevented his success. He was appointed to important commands by the Greek president, Capo D'istrias, and in 1848 and 1849 was war minister of Greece, and president of the cabinet. Recently (1862), as admiral of the fleet, he took part in the revolution which overthrew the government of King Otho.

KANAWHA, GREAT. See GREAT KANAWHA.

KANDAVU, one of the Fiji Islands (q. v.).

KANE, Sir Robert, M.D., a celebrated chemist, was born in Dublin in 1810. He was educated for the medical profession, and in 1832 was received as a member of the Royal Irish Academy, and in the same year projected the Dublin Journal of Medical Science, which at first treated only of chemical and phar­maceutical subjects. In 1840, he received the gold medal of the Royal Society of London for his researches into the colouring matter of lichens. From 1844 till 1847, K. was Professor of Natural Philosophy to the Royal Dublin Society, and in the last-mentioned year received the Cunningham Gold Medal of the Royal Irish Academy for his discoveries in chemistry. In 1846, he originated the Museum of Industry in Ireland, was appointed its first director, and the same year received from the Lord-lieutenant the honour of knighthood. At present (1863), he holds the office of President of the Queen's College, Cork. His important works are—Elements of Chemistry (1841—1842, 1849), a work of widely acknowledged merit; Industrial Resources of Ireland (1844), being the substance of a lecture delivered in the previous year, and published at the expense of the Royal Society of Dublin.

KANE, Elisia Kent, M.D., a celebrated Arctic explorer, was born in Philadelphia, United States, February 3, 1820, entered Virginia University in 1836, afterwards studied medicine, and entered the navy as a surgeon, in which capacity he visited China, India, the East Indies, and, under leave of absence, Arabia, Egypt, Greece, and Western Europe. Soon after returning home, he was ordered to the west coast of Africa in May 1846, but long attacked by fever, was compelled to return in the following April. He was then transferred to the military staff, and served in Mexico. In May 1850, he commenced his career of Arctic discovery as surgeon, naturalist, and historian to the first Grinnell expedition. In the spring of 1853, he was again sent out, this time as commander of a second Grinnell expedition, in which he achieved important results. These results are fully detailed in his Second Grinnell Expedition in Search of Sir John Franklin (2 vols. Philadelphia, 1856). In his return, in the autumn of 1855, honours were showered on the fortunate adventurer; he received gold medals from the Queen of Great Britain, the Royal Geographical Society of London, the Amer­ican Congress, and the New York Legislature; but his health, which had been precarious since 1846, was very low, and had been further injured on his return, where he grew rapidly worse, he sailed to Havannah, where he died on February 16, 1857. His life has been written by W. Elder, M.D. (2 vols. Philadelphia, 1857).

KANGAROO (Macropus), a genus of marsupial quadrupeds, of which there are many species, almost all Australian, although a few are found in New Guinea and neighbouring islands. The genus, which some naturalists subdivide, is of the family Macropodidae. The following is a list of the known species of the genus: Potoroos (q. v.), which have canine teeth in the upper jaw, while the kangaroos have no canine teeth, and in their dentition generally, and in their digestive system, make a nearer approach than any other group of those for the Euchrididae to the Potoroos, on the other hand, approaching the rodent type. Kangaroos are said sometimes to ruminate. The stomach of kangaroos is large, and is formed of a few chambers. They are omnivorous. The Macropudes are all characterised by great length of the hind legs, whilst the forelegs are small; but the radius allows a complete rotation of the fore-arm: and they make use of the fore-feet in grasping, and for manipulation, with great adroitness. The fore-feet have five toes, each armed with a strong curved nail; the hind-feet have four toes—one very large central toe, with a very large solid nail. The hind-feet are very long, though not so long as the long hind legs and the point of the tail, which is a tripod. In this posture, also, it usually walks by the hind-legs alone. The head is in form somewhat like that of a deer; the ears moderately large, and oval; the eyes large, and the aspect mild. The Great K. (M. giganteus) is generally about 74 feet in length from the nose to the tip of the tail, the tail being rather more than three feet in length, and fully a foot in circumference at the base. The height of the animal is rather more than fifty inches, in the erect sitting posture already mentioned, but it sometimes raises itself on its toes to look around it, and its height is then greater than that of a man. The Woolly K. or Red K. (M. laniger) rather exceeds it in length, but is not equalled by the Great K. It is first discovered in Cook's first voyage, 229 June 1770, and until that time it may almost be said that kangaroos were unknown to Europeans, although a New Guinea species (M. Brunii) had been described by Le Bras in 1711. It is of a grayish-brown colour, the fur being moderately long, and moderately soft. It is found in many parts of Australia and in Van Diemen's Land. It sometimes attains the weight of 160 lbs., or upwards. Its flesh is highly esteemed, and it is.
KANGAROO GRASS—KANT.

much sought after by the colonists, so that it is now rare in regions where it was once abundant. It is not properly gregarious. The kangaroos are all timid animals, making their escape from their pursuers by extraordinary leaps. The Great K. often proves too swift for greyhounds. When driven to bay, it sometimes kills a dog by a single stroke of its hind-leg, the great nail ripping him open at once. Some of the kangaroos inhabit open plains, some are more generally found in forests, some are frequent on the snowy summits of the highest Australian mountains. They are of very various size; some are not much larger than a rabbit. They are easily tamed; some species have been brought to Britain, and have bred in zoological collections, but have not yet been properly naturalised.

The exceedingly immature state in which young kangaroos are born, and the manner in which they are nourished, fail to be noticed in the article Marsupiata. Ere they finally desert the pouch of the mother, the young may be seen poking their heads out of it, and nibbling the herbage among which she moves.

KANGAROO GRASS (Anphistira australis), the most esteemed fodder-grass of Australia. It grows to a height much above that of the fodder-grasses of Britain, affords abundant herbage, and is much relished by cattle. The genus is allied to Andropogon, and has clusters of flowers with an involucre. The awns are very long and twisted, both in the K. G. and in a nearly allied species, A. ciliata, which is one of the most esteemed fodder-grasses of India.

KANO', a great manufacturing and mercantile town and capital of a province of the same name, in the empire of Sokoto, Central Africa, stands in lat. 12° 2' N., and long. 8° 22' E. The province is estimated to contain 500,000 inhabitants, and from its beauty and wealth, has been called the 'Garden of Central Africa.' The wall which surrounds the town of K. is 13 miles in circuit, and between it and the town, which is circular in shape, and is about three miles in diameter, a space intervenes large enough to supply the inhabitants with corn in case of siege. The houses are built of clay, covered for the most part with conical thatched roofs. The industry consists chiefly in the weaving and dyeing of cotton cloths, which are exported from K. to the value of £30,000 annually, to Timbuktu on the west, over the empire of Bornu on the east, and to Tripoli on the north. Dr Barth estimates the number of slaves exported from K. at 5000 annually. The population is about 30,000, but during the busiest season of the year, from January to April, it rises to about 60,000.

KANSA, in Hindu Mythology, a king of the race of Bhuja—considered also as a demon, Kālanemi, in human shape—notorious for his enmity towards the god Krishna (see VISHNU), by whom he was ultimately slain.

K'ANSAS, a river which, with its tributaries, drains the northern portion of the state of Kansas, United States of America, flowing eastward into the Missouri, into which it falls, on the eastern boundary of the state. Its northern branch, Republican Fork, rises in the Rocky Mountains.

K'ANSAS, one of the United States of America, lying between lat. 37° and 40° N., and long. 94° 40' and 106° 40' W. It is bounded on the N. by Nebraska Territory; E. by Missouri, and in part by the Missouri River; S. by Indian Territory and New Mexico; W. by Utah and New Mexico. K. averages 185 miles in width, and is 560 in length, containing 114,798 square miles; the capital is Leavenworth, and the principal towns are Atchison, Delphian, Lawrence, Leavenworth, and Topeka. The chief rivers are the Missouri, Kansas, Osage, Neosho, the Arkansas, and the branches. The greater portion of the state is rolling country, the western, level prairies. The climate has wide extremes of heat and cold, but is generally healthy. The soil is very fertile, producing all the cereals, with cotton, hemp, tobacco, and fruits. The prairies contain abundances of game, consisting of the buffalo, deer, antelope, wild-turkey, wild-goose, prairie-hen. It is sparsely timbered on the banks of the rivers. Coal, gypsum, quartz, and porphyry are among the minerals. Several tribes of Indians occupy the western portion of the state. K. was organised as a territory in 1854, and became the scene of violent contests between northern and southern settlers, on the question of slavery. Organised and armed parties of emigrants were sent from the free states, and armed bands invaded it from Missouri. A civil war broke out between these parties, both of whom formed state constitutions in 1856. After much violence on both sides, a constitution was adopted in 1856, excluding slavery, and K. was admitted into the Union, January 29, 1861. Pop. in 1860, 143,642.

K'ANSU', the most north-western province of China, is bounded on the E. by Shen-se, on the S. by Thibet and Sc-Chuen. Area estimated at from 80,000 to 100,000 square miles; pop. at 15,000,000. Its surface is mountainous; chief river the Hoang-ho. Lau-chow is the capital, and there are six other cities of the first rank.

KANT, Imanuel, one of the greatest and most influential metaphysicians of all time, was the son of a saddler, of Scotch descent, and was born at Königsberg, 22d April 1724. He was educated at the university of his native town, and after spending some years as a private tutor, took his degree at Königsberg, in 1755, and began to deliver lectures on logic, metaphysics, natural philosophy, and mathematics. In 1762, he was offered, but declined the chair of poetry, and in 1770, he was appointed professor of logic and metaphysics. He died 12th February 1804. K.'s private life was uneventful, yet curious and almost ludicrous in its mechanical regularity. As Socrates could hardly be induced to go beyond the walls of Athens, so K. clung with oyster-like tenacity to the city of his birth, never leaving it during the thirty years of his professorship.
KANT.

He remained a bachelor all his life. K. was a man of unimpeachable veracity and honour, austere even in his principles of morality, though kindly and courteous in manners to all and fearless advocate of political liberty, and a firm believer in human progress. The investigations by which he achieved the reputation of a reformer in philosophy, certainly not in metaphysical speculations or problems of that science, as to its principles and limits. The central point of his system is found in the proposition, that before anything can be determined concerning the objects of cognition, the faculty of cognition itself, and the source of knowledge lying therein, must be subjected to a critical examination. Locke's psychology, indeed, at an earlier period in European speculation, had shown a similar tendency; but before K., no thinker had definitely grasped the conception of a critical philosophy, and K. himself was led to it not so much by Locke, as by Hume's acute scepticism in regard to the objective validity of our ideas, especially of the very important idea of causality. The Kantian criticism had a twofold aim: 1st, to separate the necessary and universal in cognition from the merely empirical (i.e., from the knowledge we derive through the senses); 2d, to determine the limits of cognition. In the former of these, it is of importance to observe, that K. did not subject the old psychological doctrine of 'faculties' to any analysis, but attributed to each of these—viz., to the faculties of Sense, Understanding, Judgment, and Reason—certain unchangeable or a priori, forms of conceptions, and of functions, which, as constituting the necessary conditions of any experience whatever, possessed, on account of their subjective necessity, a universal objective validity. Thus, in the Sense, as the faculty which receives all external impressions, there must lie, according to K., the forms of Space and Time; in the Understanding, as the faculty by which the manifold in appearance is combined in the unity of conception, the Categories; in the Judgment, as the faculty which lays the foundations of the Unconditioned and the Absolute; in the Judgment, in as far as it is not merely subsumtive, but also reflective, the conception of Design or Conformity to the purpose in view; finally, in the Will or the Practical Reason, the Categorical Imperative of the Moral Law.

In regard to the latter aim of the Kantian criticism—viz., to determine the limits of theoretical knowledge—the efforts of K. have led to the conclusion that universal forms exist a priori in the human mind, can afford knowledge only under the condition that the objects which they cognize are presented by experience; while for the determining of what lies beyond the limits of Experience, they are merely empty forms, by which something indeed is thought, but nothing known. Even within the limits of Experience itself, we are cognizant, according to K., through the forms of the Sense and of the Understanding, not of things as they are in themselves, but only as they appear; hence the opposition between noumena and phenomena. But when we try to transcend these limits, and to ascertain the intelligible basis of the phenomenon, the phenomenon becomes entangled in an unavoidable Dialectic, for which there is no objective, but only a critical solution. The objects of this Dialectic, the carrying out of which constitutes an essential and leading part of the Critique of the Pure Reason, are the Soul, the World, and God; and in relation to the cosmological conceptions in particular (viz., of the Beginning and End of the World, of the Unity or Non-Unity of Things, and the ultimate Project of Things, of Causality through Freedom or through the necessity of Nature), the Reason is involved in a series of self-contradictions (in the Kantian technique, antinomies). The result, according to K., of the critical examination of all to knowledge transitional Experience in the regions of rational or speculative Psychology, Cosmology, and Theology, is the necessity for abandoning the hope of attaining such. The idea of the Unconditioned, which is supposed to be allowed to possess a regulative positive value; that is to say, it is a principle necessary for the extension of our inquiries beyond the fixed limits of experience, without, however, yielding an extended knowledge. So far the philosophy of K. is purely negative and destructive. Hamilton, MConnection, and others have—in regard to the limits of the knowable—merely reiterated the arguments of the great German, while in regard to the points in which they do differ from him, as, for example, the nature of our knowledge, it is a matter of very great doubt if they are as logical and consistent as their predecessor.

But the austere and even morbid morality of K. was something too positive to allow him to rest satisfied with merely negative results; hence he sought in the reality of his Ethics a compensation for the nihilism of his Metaphysics. He maintained the existence of a moral law, and its unchangeable validity and immutable consequences which legitimately flow from it. This validity, however, it should be observed, is simply moral, and in no way demonstrates the metaphysical reality of the ideas, which, nevertheless, by a power of its own, it compels existence and operating in the sphere of Ethics, is called by K. the Practical Reason, or the Practico-legislative Reason. The ideas which the Practico-legislative Reason postulates are, 1st, the idea of Freedom; 2d, of the existence of a moral law; 3d, of the Being of God, as the necessary condition of such a regulation of the universe as shall shew the order of nature to be the expression of a moral design. Rejecting all the ontological, cosmological, and physico-theological proofs of the existence of God as mere futilities, K. based his belief in God on the inward necessities of a practical morality. Religion,—i.e., the recognition of our duties as divine commands,—has, in the system of K., the closest dependence on Morality; in fact, becomes identical with it. This purely ethical conception of religion led him to a criticism of the dogmatic forms of religion as such, and to the establishment of what he himself called a rational religion; a religion which, according to K., is founded on the principles of the moral Law, and thus occupies the place, in which are contained most of the elements of theological rationalism. The application of the Practical Reason, as understood by K., to Aesthetics and Jurisprudence is equally fruitful of important results.—K.'s first work, Gedanken von der wahre Schlachtung der lebenden Kräfte (Thoughts on the True Estimation of the Active Powers), was published in 1747. The principal of its successors were, die falsche Spätlichtigkeit der vier syllogistischen Figuren (The False Hair-splitting of the Four Syllogistic Figures, 1762), Bedachten über das Gefühl des Schönen und Erhabenen (Observations on the Beautiful and Sublime, 1764), De Monarchia Sylvestre (On the Kingdom of England and Prussia (In the Form and Principles of the Sensible and Intelligible World, 1770); this is the prelude to his Kritik der reinen Vernunft (Critique of the Pure Reason, 1781); Grundlegung der Metaphysik des reinen Vernunft (The Foundation of the Metaphysics of Pure Reason in the Transcendental Analysis of Ethics, 1785), Kritik der praktischen Vernunft (Critique of the Practical Reason, 1788), Kritik der Urtheilskraft (Critique of the Judgment, 1790), and Religion innerhalb der Grenzen des blossen Normalen Vereins (Religion within the Limits of Mere Reason, 1793). For an account of the
influence of K. in the development of speculation in Germany, see German Philosophy.

K. has long been given to the Chinese to the fine white clay which they use in making their porcelain. It is furnished by the decomposition of a granite rock, the constituents of which are quartz, mica, and felspar, the latter having gradually multiplied, by the joint action of air and water, into this substance. A very similar clay, to which the Chinese name has been given, occurs near St Austel in Cornwall, and near Limoges in France. In these cases, it is produced by the decomposition of Pegmatite, a granite in which there is scarcely any mica, and very little quartz. All clays are silicates or hydrated silicates of alumina; and these clays, which are much valued by the porcelain-makers, may be represented by the formula $Al_2O_3·3SiO_2·2H_2O$.

Kapila, the renowned founder of the Sankhya (q.v.), one of the philosophical systems of the Hindus. Professor J. E. Hall, in his learned and excellent preface to his edition of the text-book of the Sankhya, the Sādhya-praṇāchana, says: "By the prevalent suffrage of mythology, Kapila is reputed to have been a son of Brahmā; but he is otherwise described as an incarnation of Vishnu. He is also recounted to have been born as the son of Devahuti; and again is identified with one of the Augus, Vivasvan. Lastly, it is said that there have been two Kapilas—the first, an embodiment of Vishnu; the other, the igneous principle in human disguise. It must be acknowledged, in short, that we know nothing satisfactory concerning Kapila; the mesmeric notices of him that are producible being hopelessly involved in uncertainty, and inextricably embarrassed by fable. Yet it may be credited, with but little hesitation, that he was something more substantial than a myth, and seems to be tolerably good ground for receiving, as an historical fact, his alleged connection with the Sankhya."—Bibliotheca Indica, Sādhya-praṇāchana, p. 14, seq.

Karaite. See Jewish Sects.

Karaman, Karamania, or Cara-
mania, an inland eyalet, in Asia Minor, is bounded on the W. by Anatolia, on the E. by Rumilia, on the S. by the Taurus Mountains. A cattle-breeding is the chief employment of the inhabitants, who are for the most part nomadic Turks. The town of Kara, formerly the chief and market town of this district, contains a population variously estimated at from 10,000 to 20,000.

Karamsin, Nicholas Mikhailovitch, the greatest of Russian historians, was born on 1st December 1766, at Bogoroditsa, in the government of Simbirsk. His father was an officer of Tartar descent, and placed him in the army, but he soon retired from it, and devoted himself to literary pursuits, and after a tour in Germany, Switzerland, and France, took part in establishing the Moscow Journal, and published volumes of tales, poetry, &c. But the work which first gained him a high reputation was his Letters of a Russian Traveller (6 vols. Moscow, 1797—1801), a work which exercised an extraordinary influence on the improvement of literary taste in Russia. After some other literary attempts of no great importance, he directed his attention to the history of his country. In 1803, he was appointed imperial historiographer, with a salary of 1500 roubles; and from this time he laboured uninterruptedly at his History of Russia (12 vols. Petersb. 1816—1829), for the preparation of which he had access to all the national archives. For this work, the Emperor Alexander, who desired to be furnished with the history of his times, gave him a present of 60,000 rubles. It has been translated into other languages. It comes down only to 1611.

It is in high repute in Russia, displays much research and judgment, and is, in fact, by far the most valuable work in Russian historical literature. K. died on May 13, 1826.

Karasu-Bazar, a manufacturing town in the Crimea, 25 miles east-north-east of Simferopol. It is surrounded by gardens, and contains 5 churches and a mosque. Pop. 15,287, who carry on considerable trade, and manufacture morocco leather and other articles.

Karatchef, a town in the north-west of the government of Odé, European Russia, on the Ouzjas, an affluent of the Dena, dates from the 12th c., and carries on a large trade in cordage.

Kardz'ag-Uj-Szalla's, a market-town of Hungary, capital of the district of Great Cumania, is situated about 90 miles east-south-east of Pesth. It is the centre of a district of exuberant fertility, and is the mart for the grain, fruit, wine, and cattle raised in that district. Pop. 12,000.

Karélia, an ancient province of Sweden, near the Gulf of Finland, annexed to the Russian empire by Peter the Great, and now forming portions of the governments of Finland, St. Petersburg, Novorossiisk, and Archangel. The original inhabitants were of Finnish origin.

Karengia (Pennisetum dactiliforme), a grass closely allied to the Millets, and producing a grain of the same kind. It is a native of Central Africa, and is extremely plentiful on the southern borders of the Sahara, supplying in some places the principal part of the food of the inhabitants.

Kariikal, a remnant of the once extensive possessions of France in India, lies on the Coromandel Coast, on the estuary of one of the branches of the Kaveri, within the limits of the British district of Tanjore. It contains only 63 square miles, with about 50,000 inhabitants, of whom more than 49,000 are natives. K. was ceded to the French by the Rajah of Tanjore in 1759. Having subsequently fallen into the hands of the English, it was restored at the general pacification of 1814, on condition that it should neither contain any fortification, nor possess any garrison, unless for purposes of police. This tract is of little commercial importance, for it is of but small part of the surface, but that the estuary is navigable even for coasting craft.

K. is 150 miles to the south of Madras, being in lat. 10° 55' N., and long. 79° 53' E.

Karac. See Tribes.

Karroo is the original Hottentot term, now generally adopted into the language of physical geography, for the immense barren tracts of tablelands, about 2000 feet above the sea-level, which occupy such a large portion of the surface of the Cape Colony and the region north of it. The karroos of South Africa are generally composed of shallow beds of the richest clay-soil, resting on a substratum of slaty rock, and only want the fertilising power of water to render them as productive as any other part of the surface. After heavy rains, luxuriant vegetation quickly springs up, which as quickly perishes; and the different rivers shown on maps as crossing the karroos, are generally little more than dry water-courses, with briny strings of standing pools in their beds. In the most barren portions the soil is much impregnated with alkaline matter.

The principal karroos of the Cape Colony are found extending in a north-easterly direction, between the Hottentots and Nieuwland Mountains, and the coast ranges, forming a belt of table-land about 350 miles in length, with an average width of
KARSKA’SKIA, a river of Illinois, United States of America, which rises in the eastern part of the state, and running south-west, falls into the Mississippi at Kaskaskia. It is navigable to Vandalia.

174

KASHGA’R, one of the most flourishing towns of Persia, is situated in a well-peopled, well-cultivated district, 30 miles above sea-level, and 92 miles north of Ispahan. The vicinity is celebrated for its fruit, and the town for its extensive manufactures of silk-stuffs, gold brocade, carpets, and copper-ware. It is a large town, and contains, like all Persian towns, in mosques, bazaars, baths, &c. Pop. 30,000.

KASHGAR. See CASHGAR.

KASSIMOFF, a town in the north-east of the government of Buzau, European Russia, on the left bank of the Oka, dates from the 12th century. Pop. 10,088. The chief branches of industry are tanning, rope-making, and chemicals. In the vicinity several tombs, the ruins of which are of interest, are in evidence. They date from the time of the Mongolian rule.

KASTAMUNI, a town of Turkey in Asia, is the north of Anatolia, is capital of a eyalet of the same name. The glory of this city has to a great extent departed. It contains thirty mosques, and above ten public baths; but all industrial products consist only of cotton goods, &c., and some copper-wares. Pop. 30,000.

KATRINE, Loch, one of the most celebrated of Scottish lakes, is situated near the southeast border of Perthshire. It is eight miles in length, and three-quarters of a mile in mean breadth; greatest depth, 75 fathoms; height above the sea.

KASKAT, one of the most flourishing towns of Persia, is situated in a well-peopled, well-cultivated district, 30 miles above sea-level, and 92 miles north of Ispahan. The vicinity is celebrated for its fruit, and the town for its extensive manufactures of silk-stuffs, gold brocade, carpets, and copper-ware. It is a large town, and contains, like all Persian towns, in mosques, bazaars, baths, &c. Pop. 30,000.

KASSIMOFF, a town in the north-east of the government of Buzau, European Russia, on the left bank of the Oka, dates from the 12th century. Pop. 10,088. The chief branches of industry are tanning, rope-making, and chemicals. In the vicinity several tombs, the ruins of which are of interest, are in evidence. They date from the time of the Mongolian rule.

KASTAMUNI, a town of Turkey in Asia, is the north of Anatolia, is capital of a eyalet of the same name. The glory of this city has to a great extent departed. It contains thirty mosques, and above ten public baths; but all industrial products consist only of cotton goods, &c., and some copper-wares. Pop. 30,000.

KATRINE, Loch, one of the most celebrated of Scottish lakes, is situated near the southeast border of Perthshire. It is eight miles in length, and three-quarters of a mile in mean breadth; greatest depth, 75 fathoms; height above the sea.
KÄTSENA—KAUNITZ.

about 370 feet. Its shape is serpentine, and displays great variety of shore and background. Ben Venue and Ben An are on its banks. It contains several islets, one of which, Ellen's Isle, is the centre of the action of the Lady of the Lake. Several androgynous myths were written on subjects suggested in this locality.

The waters of Loch K. are remarkably pure, having only one degree of hardness, and in all, two grains of solid matter to the gallon. The new water-supply to the city of Glasgow (q.v.) is drawn from this lake and those connected with it (Vennachar and Achray). The water is conducted first by a tunnel 6975 feet long through a mountain, and then by aqueducts, pipes, and tunnels, to the reservoir near the city—a distance of upwards of 25 miles.

KÄTSENA, a large, but now desolate town of Central Africa, capital of a province of the same name, subject to the Sultan of Sokoto, is situated in a beautiful and salubrious district in lat. 12° 54' N., and long. 7° 23' E., ninety miles north-west of Kané. It is surrounded by a wall about fourteen miles in circuit, and contained at one time at least 100,000 inhabitants. In 1807, the conquering Fülki assailed it, and a war was commenced, which lasted for upwards of a century. The capture of K. was achieved only through its destruction. It has now a population of from 7000 to 8000, and Kané (q.v.) has taken its place as the centre of commerce for the country.

KATTIMUNDOO, or CATTIMUNDOO, a substance somewhat resembling gutta-percha. It is the milky juice of the East Indian plant, Euphorbia nereifolia, and is either obtained as a natural gum, which has oozed through the bark, or by making incisions, and collecting the juice which flows. It is much used in India as a cement for knife-handles, and for similar purposes, but is not exported to other countries.

KATTYWâR, a term originally applied to one of the ten districts of the peninsula of Guzerat, has gradually been made to extend, as a collective name, to the whole of them. In this larger sense, it stretches from 20° to 27° 10' N., and from 69° 5' to 72° 14', containing about 20,000 square miles, and about 1,500,000 inhabitants. This province of India, touching on part of its eastern frontier the district of the town of Karbabad, is everywhere surrounded by water—the Bunn and Gulf of Cutch, the Arabian Sea, and the Gulf of Cambay. Politically, the country is divided among more than 290 chiefs, some of them paying tribute to the Ginewar of Guzerat, and the rest to the British government, but all of them being under the protection of the latter. Between them, these petty princes have a revenue of about £500,000 sterling, and a force of about 4000 cavalry and 8000 infantry. The climate is unhealthy, and the surface is generally undulating. The principal crops are millet, maize, wheat, sugar, and cotton.

KATYÂYANA, a name of great celebrity in the literary history of India. It belongs, in all probability, to several personages renowned for their contributions to the grammatical and ritual literature of the Brahmanical Hindus; but it is met with also amongst the names of the chief disciples of the Buddha, Sâkya-muni. The most celebrated personage of this name, however, is K., the critic of the greatest grammarian Panûni, and he is most likely the same with the K. who wrote the grammatical treatise called the Prâti-dikhya of the white Yajurveda. See VEDA. Professor Goldsborough, in his Pâni, &c., his Place in Sanscrit Literature (London, 1861), has shown that he cannot have been a contemporary of Pânini, as was generally assumed and in a paper recently read by him before the Royal Asiatic Society (February 1863), he has proved that this K. lived at the same time as the great grammarians Panûni and Patanjali, whose date can be fixed between 140 and 120 before the Christian era. See PÂTANJALI.

KATYIDID, a species of Grasshopper (q.v.) of a pale-green colour, a native of North America, very plentiful in some parts of the United States, where its peculiar note is always to be heard during the summer, from the evening twilight till the middle of the night. This note is almost like a shrill articulation of the three syllables kat-y-dil, following each other in quick succession, after which there is a pause of two or three minutes. The organ of sound is a transparent elastic membrane in a strong oval frame, in each of the wing-covers; these membranes, by the overlapping of the wing-covers, can be made to rub against one another, and the sound is produced by the friction.

KATZBACH, a small river in the Prussian province of Silesia, falling into the Oder at Parchwitz. It has become famous in history from the battle fought on its banks on 28th August 1813, between the French troops under Marshal Macdonald and the Prussians under Blucher, in which the latter were completely victorious. The French lost in the battle of the K. 5000 killed, and 15,000 wounded and prisoners, with 193 cannons, two eagles, and 220 ammunition wagons.

KAULHACH, WILHELM VON, a celebrated German painter, was born at Arolsen, in the principality of Waldeck, 15th October 1805, and in his seventeenth year entered the Academy of Arts at Düsseldorf, where he soon became one of Corinth's best pupils. He seemed thoroughly penetrated by the severely ideal and allegorical spirit of that great master, yet even from the first he displayed no lack of individual genius. Among his first important productions (1828—1829), were six symbolical figures, the best known of which is 'Apollo among the Muses.' To the same period belongs a work of a wholly different and even opposite character, 'The Moulinhouse,' conceived and executed in the most vigorously realistic style. It adversely affected K.'s reputation, and King Ludwig of Bavaria now employed him to decorate Duke Maximilian's palace in Munich. For this he executed, in the strictly antique style, a series of frescoes illustrating the fable of Psyche and Cupid. His designs from Klopstock, Goethe, and Wieland, for the same monarch, are also worthy of mention. In 1837, K. completed his 'Battle of the Huns,' a picture representing the grand legend of the continued struggle in mid-air of the souls of the Huns and Romans who had fallen before the walls of Rome, which was regarded as the culmination of the new German school. Nevertheless, the realism of which we have spoken still found expression in various works. His patient study of Hogarth is quite visible in his illustration of Schiller, of Goethe's Faust, and Reinahe Fuchs. In 1846, K. completed what is probably his chief work, the 'Destruction of Jerusalem by Titus.' It is a marvellous mosaic of history and symbolm. Of K.'s other works, it will be sufficient to mention 'The Tower of Babel' (for the new museum at Berlin), and a series of frescoes representing the history of art since the renaissance (for the Pinacothek at Munich). Latterly, he has painted a great number of portraits. K. is undoubtedly one of the greatest modern painters that Germany has produced.

KAUNITZ, WENZELKES ANTHONY, PRINCE VON,

176
Kauri—Keang-si.

Koun of Rieberg, a great Austrian statesman, born at Vienna in 1711; studied at Vienna, Leipsic, and Leyden; travelled in England, France, and Italy; and being the head of an ancient and honourable family, soon received important political appointments. For the honour of his country he undertook to fill important situations under Maria Theresa. He gained great fame as a diplomatist, in 1748, at the congress of Aix-la-Chapelle. He was afterwards Austrian ambassador at the French court; and in 1753, served as anointed court and state chancellor, and in 1756 chancellor also for the Netherlands and Italy, and continued for almost forty years to have the principal direction of Austrian politics. The project of the partition of Poland originated with him. He had so much to do in the management of the political affairs of Europe, that he was jocularly called the "European coach-driver." He was very vain and confident of his own abilities, so that his highest praise for anything which he thought well done was to say with an oath: 'I could not have done it better myself.' He was narrow in his political views, regarding exclusively the supposed interests of Austria, but sincere and upright according to the notion of his duty. He took a very active part in the ecclesiastical reforms of Joseph II., so that at Rome he was styled the 'heretical minister.' He was a liberal patron of the arts and sciences. He retired from public life on account of old age, when Francis II. ascended the throne, and died 27th June 1794.

Kauri, or Kowrie, or K. Pine (Dammara elongata), a species of Dammar, (q. v.), a native of New Zealand. It is a tree of great size and beauty, and sometimes, in size and height, is equal to a height of 140 feet or more, with whorls of branches, the lower of which die off as it becomes old. The timber is white, close-grained, durable, flexible, and very valuable for masts, yards, and planks. It is much used for masts for the British navy, no other being considered equal to them. The Fiji Islands, New Hebrides, and Australia produce other species, the timber of all of which is sold under the name of K. Pine, although there are differences of quality. All of them also produce a resin called K. Resin, or K. Gum, and sometimes Australian Copal and Australian Dammar, of which large quantities are imported into Britain and North America, chiefly for the manufacture of strings. It is in fact sometimes found in pieces as large as a child's head, of a dull amber colour, where forests of these trees have formerly grown, and is obtained by digging. It is also collected from the resin from which it has newly exuded, and is then of a whitish colour. It is used for making varnishes, &c.

Kavana. See Aya.

Kazan, a town of Russia, capital of the government, and ancient capital of the kingdom of the same name, is situated on the river Kazanka, four miles from the north bank of the Volga, and 200 miles cast-south-east of Niijni-Novgorod. It was founded in 1257 by a Tartar tribe, and after various vicissitudes, was made the capital of an independent kingdom, by the Khan of the Golden Horde, which flourished in the 13th century. In 1552, the Russians, under Ivan the Terrible, carried the town after a bloody siege, and put an end to the existence of the kingdom. Pop. 88,129. K. contains 70 churches and 9 mosques; a university, the Academy of Government, and other educational establishments. The manufactures are leather, soap, cloth, and silk.

Kazan (in Tartar, a golden-bottomed bottle), a government of Russia, between Astrakhan on the east, and the government of Nijjni-Novgorod on the west. Area, 23,650 square miles, 14th of which is cultivated, 4th in pastures, and 4th covered with forests. Pop. about 1,340,340—mostly Christians, with a number of Moslems, and some Jews.

Kazimierz, a town of Poland, in the government of Lublin, on the right bank of the Vistula, 30 miles cast-south-east of Radom. It was founded in 1350, and formerly carried on a flourishing trade in flax and hemp. It is a large town, and has many fine houses; among which, the government house is remarkable. The castle stands on an eminence, and was built in 1239. It is the residence of the bishop of Krakau.

Keang-si, an inland province of China, lies immediately north-west of the maritime province of Fo-kien. See Chinese Empire.
KEANG-SU—KEITH.

KEANG-SU, an important maritime province of China, the wealthiest and most densely peopled district of China. See CHINESE EMPIRE.

KEATS, John, an English poet, was born in London in 1796. He was educated at Enfield, and was afterwards apprenticed to a surgeon. Certain of his sonnets were published in the Examiner; then edited by Mr Leigh Hunt, and reprinted with additional serial admiration. He published in 1817 his first volume of poems; and in the following year Endymion appeared, dedicated to the memory of Thomas Chatterton. This poem was severely handled in the Quarterly Review and in Blackwood. He published a third volume of poems containing Lamia, Isabella, Eve of St Agnes, the fragment of Hyperion, and the odes to the Nightingale and the Grecian Urn. His health was at this time delicate; and shortly after the publication of his book he went to Italy, and died at Rome, on the 24th February 1821, his last moments soothed by the tender care of Mr Severn the artist. The English pilgrim can see his grave and Shelley's in affectionate neighbourhood. An admirable memoir of K., with copious selections from his letters, has been published by Monckton Milnes, Esq., M.P.

K.'s early poems are disfigured by conceits and affections, but his last place him amongst the greatest masters of the art. The Ephebaes is as melodious as any portion of the Faery Queen; Hyperion has something of the organ-tone of Milton. His influence is strikingly apparent in the subsequent efforts of the English muse—Brownings has his colour without his melody, Tennyson has his colour and his melody both.

KECKEMET, a town of Hungary, 54 miles south-east of Pesth, is a station on the railway between that city and Temesvar. It is said to be the greatest market-town in the country, and with its extensive suburbs, its streets, straggling and low buildings, may be considered as a type of the Magyar town. Agriculture and vine-growing are carried on to some extent; but the inhabitants are chiefly employed in rearing cattle, sheep, horses, and swine. Five markets are held here annually; the cattle-market, which lasts for fourteen days, is the most important in Hungary. Pop. 39,434.

KEDGE, or KEGE-ANCHOR, a small anchor used in bagging vessels or of local vessels of the sea. It is clear of the bow or principal anchor. Another use of the kedge is to move the ship from mooring to mooring in a harbour; for this purpose, it is conveyed to a distance in a boat, then dropped, and the vessel hauled up towards it by a cable attached.

KEIDJERI, a seaport of Bengal, stands on the west side of the most westerly channel of the Hooghly, once the principal approach to Calcutta from the sea. Between it and the metropolis there runs a telegraphic line of about 40 miles in length, being the first work of the kind in India.

KEEL is the backbone, as it were, of a ship, running longitudinally along the middle of the bottom. It consists of massive timbers clinched together lengthwise. From it spring, on either side, the ribs on which the ship's sides are laid, and from it, at the bow and stern respectively, the stem and the stern-post. As the decks bear by transverse beams upon the ribs, it follows that the whole weight of the ship and its contents exercise an oblique lateral pressure on each side of the keel, that is usually protected by strong iron binding, so that the keel may be as little injured as possible. In the case of iron vessels of modern construction, the keel is frequently dispensed with, corresponding strength being obtained by internal tie-beams, &c.; but the absence of the keel takes away one preventive to rolling from side to side. To be 'on an even keel,' is to have the ship's surface of the water, i. e., the bow and stern evenly deep.

KEEALGE, a toll or custom payable by ships for resting in a port or harbour.

KEEHALING, a punishment in use, formerly in use, for sailors in the Dutch navy. The floor-timbers are passed below each being bolted through the keel, and alternate ones through the keelson. Like the keel, the keelson is composed of several massive timbers scarfed together.

KEEP, in medieval fortification, was the central and principal tower or building of a castle, and that to which the garrison retired, as a last resort, when the outer ramparts had fallen. See CASTLE. A fine specimen of the ancient keep is still extant amid the ruins of Rochester Castle.

KEEPER OF THE GREAT SEAL, a judicial officer, whose duties are now generally merged in those of the lord chancellor.

KEEPING THE PEACE. When a person has been assaulted, or is apprehensive of an assault, he may apply to justices to order the assaulting or threatening party with certainties to keep the peace. This is done by the justice ordering the party to enter into recognisances under articles of the Peace (q. v.), called in Scotland a bond in pursuance of letters of Lawburrows (q. v.).

KEI RIVER, Great. This important stream divides British Kaffraria on the south-west from Kaffraria Proper, and with its branches, the Black or White Kei, the Inywe and Tzomo, all rising in the Transkei, and pouring into the South Atlantic Ocean, is about 7000 miles in length. It is very rugged in its lower course, and its mouth, like all other Kaffrarian rivers, is hopelessly barred. Its banks have been the scene of several severe conflicts during our wars with the Kafir tribes.

KEIGHLEY, a market and manufacturing town in the West Riding of Yorkshire, is situated on the river Aire, nine miles north-west of Bradford. Among the few interesting institutions of the town, is the Free Grammar-school, with an endowment of £240 per annum. The worsted manufactures are important, and machine manufactories and paperworks are in operation. Pop. (1861) 15,063.

KEISKAMMA. This river forms the boundary between the Cape Colony and that of British Kaffraria. It is a purely Hottentot name, signifying 'clear water.' It rises in the Amatola, and with its branches, the Chumie and Gaga, waters a very fertile tract of country, formerly the head-quarters of the Amazons. It is now densely settled with industrious German and English settlers.

KEITH, The Family of. The origin of this, as of most other Scottish historical houses, is unascertained. It first appears in record during the latter half of the 12th century, and is said to have existed from the lands of Keith in East Lothian, to which the office of the king's marischal was attached.

177
KELAT.—KELLS.

The family enters the page of history in the beginning earnestly erected to, 1365, Sir Robert of Kept, hereditary mariscal of Scotland, is found high in the confidence of King Edward I. of England, holding under him the office of joint justiciar of Scotland from the Forth to the Monadh, and sitting in the English council at Westminster as one of the representatives of Scotland. He kept his allegiance to England for some years after Bruce was crowned king of the Scots, but joined that prince before Bannockburn, where he commanded the van and, by a well-timed charge upon the English archers, contributed not a little to the fortune of the day. His services were rewarded by a large grant of land in Aberdeenshire; and the possessions of the family were still further increased, before the close of the century, by marriage with one of the co-heiresses of Sir Alexander Fraser, chamberlain of Scotland, Bruce’s brother-in-law. Through this alliance, the Keiths acquired great estates, and having added to them the remarkable sea-girt rock of Dunnottar, they built or restored a castle upon it, which was henceforth their chief seat.

Earl Marischal.—About 1458, the family was enriched in the person of Sir William Keith, who was created Earl Marischal and Lord Keith. His house reached its highest pitch of power in the person of his great-great-grandson, the fourth earl, nicknamed, from the accession in which he lived at Dunnottar, “William who kept the Tower.”4 His marriage with his kinswoman, the co-heiress of Inverurie, he nearly doubled the family domains, which now included lands in seven shires, Haddington, Linlithgow, Kinneaird, Aberdeen, Banff, Elgin, and Caithness. He was regarded as the wealthiest peer in Scotland, having a rental of 270,000 marks a year, and being able, it was boasted, to travel from the Tweed to the Pentland Firth, eating every meal and sleeping every night on his own lands. These vast possessions passed to his grandson, George, the fifth earl, who, in 1593, founded the Marischal College and University of Aberdeen. Its walls were inscribed with the words: ‘THAT HAD SAYS; QUEHAT HAV SAYT; LAT THAME SAYT,’ in allusion, it would seem, to the popular reproach which the earl had brought upon himself by adding the lands of the ancient abbey of Deer (q. v.) to his already overgrown estates. The story ran, that his wife, during her enforced and restricted imprisonment, by the suggestion of her youthful son, ‘but fourteen score chalder of meal and beer was a sore temptation,’ says Patrick Gordon of Chiny, and the earl was deaf to her entreaties. Hereupon, it is said, she dreamed a dream, which was thought to portend the downfall of the House of Keith. She saw the monks of Deer set themselves to work to hew down the crag of Dunnottar with their pen-knives, and while she was laughing them to scorn, ‘behold!’ the whole crag, with all its strong and stately buildings, was undermined and fallen in the sea.” This was written before 1660. Within little more than half a century, Dunnottar was in ruins, and its lord a landless exile. At the age of 22, George, the tenth and last Earl Marischal, took part with his younger brother James in the rising of 1715. He was attainted, and his estates (yielding £1676 a year) were forfeited; but he himself escaped abroad, where he rose to distinction in the Prussian service as a member of a commission sent by the British government for the purpose of a political secret which he learned when Prussian ambassador at Madrid, procured his pardon in 1739. A year or two afterwards, he revisited Scotland, and bought back part of the family estates, but refused the proffered restoration of the family titles. He speedily returned to Prussia, and died there in 1778 at the age of 86. His brother, who had risen in the Prussian service to the rank of field-marshall, fell at Hochkirchen, 7th September, 1758.

Lords Keith.—Neither having any issue, the direct male line of the House came to an end. His sister, Lady Mary, by her marriage, in 1711, with John, sixth Earl of Wigtoun, had a daughter, Lady Clementina, who married Charles, tenth Lord Elphinstone, by whom, besides other children, she had Sir George Keith Elphistone, who, in 1757, was created Lord Keith of Stonehaven Marischal in the Irish peerage, and in 1803, Lord Keith of Balmyle in the peerage of the United Kingdom. His daughter, Baroness Keith, is the wife of the Count de Flahaut.

Earls of Kintore.—Sir John Keith, third son of the sixth Earl Marischal, was, for his services in saving the Scottish Regalia during the Common wealth, raised to the peerage by the titles of Earl of Kintore, and Lord Keith of Inverurie and Keith hall. On the death of his grandson, the fourth earl, in 1761, the estates devolved on the last Earl Marischal; and on his death in 1774, the estates and titles passed to Alexander, sixth Lord Falconer of Halkerton, the grandson of the eldest daughter of the second earl. Her descendant is now the ninth Earl of Kintore and eleventh Lord Falconer of Halkerton.

KELAT, the capital of Beloochistan, stands at an elevation of more than 7000 feet, in lat. 28° 52' N., and long. 66° 33' E. The district round about is fruitful, and thickly peopled. K. contains about 12,000 inhabitants. Scouted on the summit of a hill, it is a place of military importance. In the Afghan wars, it was twice taken by the British.

KELLERMANN, FRANCOIS CHRISTOPHE, Duke of Valmy, born 28th May 1753, at Wolfschweiler, in Alsace, entered the French army, and had risen to the rank of a maréchal-de-camp before the Revolution broke out. He warmly espoused its cause, and contributed much to its progress in Alsace. In 1792, he received the command of the Army of the Centre on the Meuse, repelled the Duke of Brunswick, and delivered France by the famous cannonade of Valmy. Yet, on an allegation of treason against the republic, he was imprisoned for ten months, and only liberated on the fall of Robespierre. He afterwards rendered important services in Italy, and on the erection of the French Empire he was made a marshal of France. In the campaigns of 1809 and 1812, he commanded the reserves on the Rhine. At the Restoration, he attached himself to the Bourbons. He was moderate and constitutional in his views. He died 12th September 1824.

KELLS (originally, Kenliss), an ancient corporate town of the county of Meath, Leinster, Ireland, is situated on the Blackwater, 13 miles north-north-west of Trim, and has been associated, from a very early period, with the most important events of Irish history, sacred and profane. The town originated a monastery, which was founded in the middle of the 6th c. by St Columba, and among its antiquities, which are most numerous and interesting, are shown a stone-rolled out chapel, evidently of very great antiquity, and popularly regarded as built by St Columba. K. was frequently plundered in the wars of the Danes, and after the Conquest, it became an important stronghold of the Pale. It was returned two members to the Irish parliament. Its oldest charter is of 11 and 12 Richard II. This was modified by several succeeding charters, under which the municipal body was maintained by the Irish Municipal Reform Act, which created a body of town commissioners. The population in 1851 was 3997; in 1861, it had fallen to 3225, of whom 728
2988 were Roman Catholics, and 331 members of the Established Church.

**KELP** (Fr. *kérl*) is the crude alkaline matter produced by the combustion of sea-weeds, of which the most valued for this purpose are, *Fucus vesiculosus*, *F. nodosus*, *F. serratus*, *Laminaria digitata*, *L. bulbosa*, *Himanthalia loeselii*, and *Chorda filum*. These are dried in the sun, and then burned in shallow excavations at a low heat. About 20 or 24 tons of sea-weed yield one ton of kelp, which, as met with in commerce, consists of hard, dark-gray or bluish masses, which have an acrid, caustic taste, and are composed of chloride of sodium, of carbonate of potash, chloride of potassium, iside of potassium or sodium, insoluble salts, and colouring matter. It is used to be the great source of soda (the crude carbonate); but as this salt can now be obtained at a lower price and a better quality from the decomposition of sea-salt, it is prepared in far less quantity than formerly. A ton of good kelp will yield about eight pounds of soda (which is solely obtained from this source), large quantities of chloride of potassium, and additionally, by destructive distillation, a large quantity (from four to ten gallons) of volatile oil, from four to fifteen gallons of percolating oil, three or four gallons of naphtha, and from one to a half to four hundredweights of sulphate of ammonia.—Ansted's *Channel Islands*, p. 515. Except the iodine and chloride of potassium, none of these substances are obtained under the present tons of kelp.

In Brittany, the total annual production of kelp is almost as much as 24,000 tons, while in all the British Islands the total manufacture is only 10,000 tons. Professor Ansted, in the work already quoted, shews that the stream from which these quantities are obtained is a source of great wealth to the Channel Isles. The Guernsey sea-weed is stated by Professor Graham to be the richest known source of iodine, and the increasing demand for that substance for photographic purposes renders the subject highly important. From the numerical data given in pp. 514, 515, of the *Channel Islands*, it appears that they might yield annually about 10,000 tons of kelp, worth about £4 per ton. The British supply would thus be augmented.

Before the remission of the duty on salt and on Spanish barilla, the kelp manufacture was carried on to a very large extent, and the value of many estates in the Scottish Highlands and Hebrides greatly increased in consequence of it. The rent of some farms in the Orkneys rose from £10 to £200 a year. Many thousand tons were made annually on the shores of Great Britain, which sold for £7 to £10 per ton, and employment was given to a great number of people. The regular cultivation of the sea-weed was even proposed, and to some extent carried into effect, by placing large stones within tide-mark upon sandy shores, which were soon covered with it.

**Kelp**, in point of law, if found beyond high-water mark, belongs to the owner of the adjacent land. The right to kelp is often let by the owner separately from the lands in the Highlands of Scotland.

**KELO**, a town in Scotland, finely placed on the north bank of the Tweed, opposite to the right bank of that stream. It is called *Pacora* by the Teviots. The name was anciently written *Kalcha* or *Callow*, and is supposed to have had its origin in a precipitous bank abounding in gypsum, and frequently transplanted to the Tweed. It was of its importance, if not its existence, from a richly endowed abbey of Tironensian monks, planted at Selkirk in the year 1113, by King David I., when Prince of Cumbria, and transplanted, after his accession to the Scottish throne, to the church of the blessed Virgin Mary, on the bank of the Tweed beside Roxburgh, in the place called Calvoun. The abbey was ruined by the English under the Earl of Mortimer in 1541, and all that now remains of it is part of its church. It is in the later Norman or Romanesque style, and had a nave of two bays, north and south transepts each of two bays, a central tower still 91 feet high, and a choir of uncertain length. The more modern parts of the town are well built. A handsome bridge, designed by Remme, connects Kelso with its suburb of Maxwellock, and commands a noble view. On the north-west of the town, in the midst of a beautiful park, is Floors Castle, the seat of the Duke of Roxburgh: it was built in 1718, from the design of Sir John Vanbrugh, and was enlarged and improved by the present duke from the designs of the late Mr Playfair of Edinburgh.

On the opposite bank of the Tweed are the ruins of Roxburgh Castle, once the strongest fortress on the eastern border. The town of Roxburgh, which rose under the shelter of its walls to be one of the four chief towns of Scotland, has so disappeared, that scarcely a vestige of it remains. It was a made a borough of barony in 1634. It has no manufactures, and little trade, although three newspapers are published in it. Its population in 1861 was 439.

**KEMBLE, JOHN PHILIP**, son of Roger Kemble, an actor, was born at Prescot, in Lancashire, on the 1st February 1757. He received his education at a school in Worcester, afterwards at a Roman Catholic seminary in Staffordshire, and finally at the English College of Douai, in France. On his return to England, he adopted the stage as his profession, making his first appearance at Wolverhampton on January 8, 1776. On the 30th September 1783, he made his first appearance at Drury Lane in Hamlet—always a favourite character of his—and in 1790, he succeeded to the management of that theatre. In 1803, he purchased a share in Covent Garden Theatre, of which he also became manager. On the destruction of the building by fire, K. raised a new theatre, which was opened in 1809, the management of which he retained till the close of his theatrical career. In June 1817, he took leave of his patrons in London; and a few days thereafter a public dinner was given to him, under the presidency of Lord Holland. Thomas Campbell made his retirement from the stage the subject of a spirited set of verses. He finally took up his residence in Switzerland, where he died, on the 26th February 1823, aged sixty-six years.

K. was a great actor, and he loved to personate the loftier characters of the drama—kings, prelates, heroes. His figure was commanding, his voice sonorous and well modulated. He was especially successful in Brutus and Coriolanus; and the ancient playwrights, who remembered his intonation and his Roman look, find the stage of the present day, comparatively unworthy of regard.

**KEMBLE, CHARLES**, brother of the foregoing, was born at Brecknock, in South Wales, on the 25th November 1775. He received his education, like his brother, at Douai, and like him also, he, on his return to England, devoted himself to the stage. In April 1794, he made his first appearance at Drury Lane in the character of Malcolm. In July 1806, he married Miss De Camp, a lady who had hitherto been distinguished for the value she attached to her profession. K., on being appointed Examiner of Plays, relinquished the stage on the 10th April 1840. He
died on the 12th November 1834, having almost completed his 79th year.

KEMBLE, JOHN MITCHEL, chiefly distinguished for his work within the Saxon Studies, and the early history of England, was the son of Charles Kemble, and was born in London, 1807. He studied at Trinity College, Cambridge, where he took the degree of B.A. in 1830, and afterwards that of M.A. While an undergraduate, he spent some time at Göttingen, under Jacob Grimm, which perhaps determined the bent of his mind towards Anglo-Saxon studies. The first fruits of these studies was an edition (1833) of the poem of Beowulf (q. v.), to a second edition of which he added a translation, with a glossary and notes. Not to mention several minor publications, he edited for the English Historical Society a valuable collection of charters of the Anglo-Saxon period, entitled Codex Diplomaticus Regi Saxoniae, 2 vols. (1839—1840). But his most important work, which contains the chief results of all his researches, is The Saxons in England, 2 vols. (1849). This work is unfinished. The author had been making preparations for two more volumes, which he died suddenly, March 26, 1857. K. was for a good many years editor of the British and Foreign Review; he also held the office of Censor of Plays, under the Lord Chamberlain.

KEMPIS, Thomas, so called from his native place, Kempen, a village in the diocese of Cologne, was probably born in 1379. His family name was Hämersen (Latinized, Malbodius, 'little-hammer'). He was educated at Deventer, and in 1400 entered the Augustinian convent of Agnetenberg, near Zwoll, in the diocese of Utrecht, of which his brother John was prior, in which he took his vows in 1408. He entered into priest's orders in 1413, and was chosen sub-prior in 1429, to which office he was re-elected in 1448. His whole life appears to have been spent in the seclusion of this convent, where he lived to an extreme old age. His death took place in 1427, at which time he certainly had attained his 90th year, and most probably his 92d. The character of K., for sanctity and ascetic learning, stood very high among his contemporaries, but his historical reputation rests almost entirely on his writings, which consist of sermons, ascetical treatises, poems, biographies, letters, and hymns. Of these, however, the only one which deserves special notice is the 'Imitation of Christ,' an ascetical treatise. In the Imitation (or Imitation of Christ), the authorship of which is popularly ascribed to him. This celebrated book has had, next to the sacred Scripture itself, the largest number of readers of which sacred literature, ancient or modern, can furnish an example. In its pages, according to Dean Milman (Latin Christianity, vi. 482), 'is gathered and concentrated all that is elevating, passionate, profoundly pious in all the 14th mysteries. No book, after the Holy Scripture, has been so often reprinted; none translated into so many languages, ancient and modern,' extending even to Greek and Hebrew, or so often retranslated. Sixty distinct versions are enumerated in French alone, and a single collection, formed at Cologne within the present century, comprised, although confessedly incomplete, no fewer than 500 distinct editions. It is strange that the authorship of a book so popular, and of a date comparatively so recent, should still be the subject of one of the most curious controversies in literary history. The book, up to the beginning of the 17th c., had been ascribed either to Thomas or to the celebrated John Gerson (q. v.), chancellor of the university of Paris, except in one MS., which, by a palpable anachronism, attributes it to St Bernard; but in the year 1604, the Spanish Jesuit, Mauriguez, found a MS., which is now attributed to the abbey, John Gerson, or Gerson, which he regarded as clearly a distinct person from the Chancellor Gerson. From time to time this discovery, three competitors have divided the voices of the learned—not alone individuales, but public bodies, universities, religions orders, the Congregation of the Index, the parliaments of Paris, and even the French Academy; and the ascertainers of these respective claims have carried into the controversy no trifling amount of polemical acrimony. The most recent and best account of the discussion, as well as its history, will be found in Malou's Recherches historiques et critiques sur le véritable Auteur du Livre de l'Imitation de Jésus Christ (Louvain, 1849). We shall only state that M. Malou gives his verdict in favour of the claim of Thomas K., an opinion in which the learned have now generally acquiesced. The first edition of the Imitation was printed at Augsburg, in 1468, and before the end of that century, it was reprinted upwards of 20 times in Germany. The most remarkable modern edition is a Heptaglot, printed at Salzbach (1837), containing, besides the original, later versions in Italian, Spanish, French, German, English, and Greek. The theology of the Imitation is almost wholly pre-Byzantine, and (except the 4th book, which regards the Eucharist, and is based on the doctrine of the real presence) the work has been used indiscriminately by Christians of all denominations.

KEMPTEN (anciently, Campodounum, Campion, a city of Bavaria, situated on the river Iller, 64 miles south-south-west of Augsburg, with which it is connected by railway. Locally it is called Illert). It was an ancient seat of the Swabian cities, K. grew up around a monastery, which was founded by the disciples of the great Irish missionary monk, St Gall, about the end of the 7th century. Partly by the favour of the emperors, partly through the natural sequence of the events of the period, the abbots of the monastery were the successors of the town and its environs, and eventually the abbots of K. became a prince-abbots of the empire (1348). In the secularisation of the ecclesiastical principalities in 1803—1804, it shared the common fate; the abbey, as well as the city and territory—comprising at that time 7 market-towns, 85 villages, and above 40,000 inhabitants—being sold to Bavaria, the present name of K. contains about 8000 inhabitants, and is divided into the abbatual town (Stifts-Stadt) and the city proper, which lies in the plain at the foot of the hill on which the abbey stands. It is a place of considerable trade, and carries on manufactures of cotton and linen.

KENDEL, or KIRKBY KENDAL, a municipal and parliamentary borough of England, in the county of Westmoreland, is situated on the right bank of the Kent, 22 miles south-south-west of Appleby. Here, in the reign of Edward III, a settlement of Flemings, under a certain John Kemp, was formed, and afterwards the town became well known for its manufactures of woollen cloths, called, from the name of the town, Kendals. The letter of protection, dated 1221, and granted by King Edward III, 'on behalf of John Kemp of Flanders, cloth worker, concerning the exercise of his craft,' may be found in Rymar's Poem De, vol. ii. p. 283. The name, 'Kendal,' is still applied to the cloths produced here, consisting of woollen cloths, cottons, worsteds, damasks, tweeds, and coates, being the staple manufactures of the town. In the immediate vicinity are also several mills, dye, marble, and paper works. The weekly market is the chief article of trade, and various fairs and carnivals in the county. K. returns one member to the imperial parliament.
KENILWORTH—KENT'S HOLE.

KENILWORTH, a market-town of England, in the county of Warwick, situated 41 miles north of the town of that name, and the fashionable town of Leamington. Tanning operations are here carried on upon a large scale, and hemp-linters to some extent. Pop. (1861) 3676. The town, however, is chiefly interesting from historical association. The castle of Kenilworth, united to the crown domains in the reign of Henry IV., was conferred by Elizabeth upon Sir Thomas Tresham. Dudley, Earl of Leicester, who, in 1575, entertained his sovereign for 17 days, at a daily cost of £1000. The present noble owner is the Right Honourable the Earl of Clarendon. Extensive remains of the castle still exist, which are well preserved, and much visited by the aristocracy and by tourists from all parts of the country. There are also ruins of the ancient monastery.

KENNEBEC, a river in Maine, United States, which rises in Moosehead Lake, in the west of the state, and runs in a southerly direction into the Atlantic Ocean, after receiving the Androscoggin, 18 miles from its mouth. On its banks are the important towns of Bath, Gardiner, Hallowell, and the state capital, Augusta. It is navigable by ships to Bath, 12 miles; by steam-boats to Hallowell, 40 miles, and Augusta, 60 miles, above, and 1000 feet, affording abundant water-power. At Augusta are falls, increased by a dam, 584 feet long, supplying water to large factories, saw-mills, &c.

KENEICOTT, Benjamin, an eminent biblical scholar of the last century, was born at Totness, in Devonshire, April 4, 1718, and educated at Oxford, where he highly distinguished himself. He took his degree of M.A. in 1750, having been previously elected a Fellow of Exeter College; in 1757, he was appointed Radcliffe librarian; and in 1770, Canon of Christ Church, Oxford, where he died, September 18, 1783. The whole interest and importance of K.'s life are comprised in his great undertaking for the improvement of the Hebrew text. In 1753, he published a work entitled The State of the Printed Hebrew Text of the Old Testament Considered. This contained, among other things, observations on 70 Hebrew MSS., with an extract of mistakes and various readings, and strongly enforced the necessity for a much more extensive collation, in order to ascertain or approximate towards a corrected text. He undertook to execute the work in the course of 10 years, and laboured, until his health broke down, from 10 to 14 hours a day. In spite of complications occasioned from Bishopp, Porson, Horne, and other divines, K. succeeded in enlisting the sympathies and obtaining the support of the clergy generally. Upwards of 600 Hebrew MSS., and 16 MSS. of the Samaritan Pentateuch, were collated, with the assistance of other English and continental scholars. The first volume of his edition of the Hebrew Bible appeared in 1776, and the second in 1780, accompanied by a very useful and instructive dissertation. The text chosen was that of Van der Hooght, and the various readings were pointed at the bottom of the page. The Varia Lectiones Veteris Testamenti (Parma, 1784-1788), published by De Rossi, is a valuable addition to K.'s Hebrew Bible. Jahn published at Vienna (1806) a very corrected text, embracing the most important of K.'s readings.

KENNING TO THE TERCE, a phrase in Scotch Law to denote the process by which a widow, whose husband has died intestate in lands, acquires a separate interest in a definite part thereof. Such lands, if not entitled to the rents of any third of the husband's lands, called her Terce (q.v.); and the above process is carried on before the sheriff of the county, the object being to define and set out a particular portion of the lands to which her life-

KENSINGTON GARDENS, one of the public ornamental parks of London, extends on the west side of Hyde Park, from which it is partly separated by the Serpentine. It is traversed by walks, and ornamented with rows of clipped lyme and other trees. Near the western border of the park stands Kensington Palace, an edifice of brick, originally the seat of Henesage Finch, Earl of Nottingham and Lord Chancellor of England, and was afterwards bought by King William III. William III., Queen Mary, Queen Anne, and George II. all died in this palace, and here her Majesty Queen Victoria was born. The gardens at first consisted of the grounds attached to the palace, and were only 26 acres in extent, but have been frequently enlarged, and now are two and a half miles in circuit.

KENT, an important maritime county of England, occupies a portion of the south-east angle of the country, and is bounded on the N. by the estuary of the Thames, and on the E. and S.E. by the Strait of Dover. Area, 1,039,419 statute acres; pop. (1861) 733,887. Besides the river which forms the northern boundary of the county, the chief streams are the Medway, the Darent, and the Darent, all of which flow north-east into the estuary of the Thames. The surface is undulating, being traversed from west to east by the North Downs (see article Downs). With a climate which is in general mild and genial, and a fertile soil of mixed chalk, gravel, and clay, K. is, in an agricultural sense, a highly productive county. Besides the usual crops, great quantities of seeds are raised for the London markets, as canary and radish seeds, spinach, cress, and white mustard. There are also numerous market-gardens and orchards. Hope (q.v.) are one of the chief products of the county. Twenty-nine thousand acres, forming in a half, or more than twice as extensive as that of any other hop-growing county of England, are here devoted to the cultivation of this plant. Great numbers of sheep are fattened on the excellent pasturage found on the tracts of alluvial soil that skirt the banks of the Thames and Medway, and especially on the Romney Marsh, which comprises 44,000 acres. The county returns four members to parliament.

K. is unusually rich in historical association. For its early history, see article Haverfordwest. It has been the scene of frequent sieges, battles, and revolutions; and the county is also bound up with the social history of the country through the three well-known insurrections which broke out here under Wat Tyler, Jack Cade, and Sir Thomas Wyatt. Of its numerous and interesting ecclesiastical edifices, it will suffice to specify here the cathedrals of Canterbury and Rochester. It contains the important dock-yards and arsenals of Woolwich, Chatham, and Sheerness; and the famous watering-places of Margate, Ramsgate, and Tunbridge Wells.

KENTIGERN, Sr. See Muxgan, Sr.

KENTISH FIRE, a term employed to denote the vehement and protracted conflagration which the rabble greeted the No-popery orators at the public meetings held in Kent to prevent the passing of the Roman Catholic Relief Bill (1828—1829).

KENTISH RAG, a dark-coloured, hard, calcareous sandstone, which occurs at Hythe, and other places on the coast of Kent, in the Lower Greensand Measures. It sometimes attains a thickness of 60 or 80 feet.

KENT'S HOLE, a large cave in the limestone rock near Torquay, Devon. It is said to be 600 feet.
feet long, with a breadth varying from 2 to 70 feet, and a height from 3 to 18 feet. The bones of the cave-bear, hyaena, &c., have been found in the mud of the cave below the stalagmitic covering. See CAVES.

KENTUCKY, one of the United States of America, in lat. 36° 30'-39° 6' N., and long. 82° 2'-89° 40' W., is bounded on the N. by the Ohio River, on the E. by Virginia, on the S. by Tennessee, and W. by the Mississippi River. Area, 3,266 square miles, or 141,153 square statute miles, and 110 counties. The capital is Frankfort, and the chief towns, Louisville, Covington, Lexington, Mayville, Paducah, Columbus, and Hickman. The country is rolling, hilly in some portions, and in the south-eastern and southern parts perpendicular limestone to 3,000 feet. Its chief rivers are the Ohio and Mississippi on its borders, and the Tennessee, Cumberland, Kentucky, Licking, and Green. The soil is mostly fertile, and contains some of the finest agricultural regions in America, producing wheat, maize, cotton, hemp, tobacco, and all the fruits of the warmer temperate regions. Herds of cattle find rich pasture, and millions of swine fatten in the woods. There are coal-beds, some rich in oil, extending nearly across the state. Of the many caverns in the Mammoth Cave (q. v.) is the most celebrated. There are also deposits of lead, iron, beautiful marbles, and salt. There are 557 miles of railways, a taxable property of 500,000,000 dollars, and annual agricultural products of 75,000,000 to 100,000,000 dollars. There are in the state 15 colleges, with academies and public schools, containing 85,914 pupils; 1,843 churches; and 62 newspapers. Kentucky, formerly a portion of the western territory of Virginia, was once the home of many powerful and warlike Indian tribes, whose sagacious counsels gave it its name, which signifies 'the dark and bloody ground.' It was settled by Daniel Boone (q. v.) in 1769, organized as a territory in 1792, and admitted as a state in 1792. Upon the breaking out of the rebellion in 1861, strenuous efforts were made, by Governor Magoffin to force the state into the vortex of secession, or at least to place her in an independent, neutral condition. The state, however, prevailed, and the loyalty of the state was maintained, though many of her citizens joined the ranks of the rebels. Pop. in 1860, 1,155,715, of whom the slaves numbered 225,490.

KEFONUK, a city of Iowa, is the south-east corner of the state, on the Mississippi River, 205 miles above St. Louis. It is the site of the State Medical College, and has several academies, 12 churches, 50 manufacturing establishments, and a large commerce, being at the head of the low-water navigation of the Mississippi, and the terminus of two railways. Pop. in 1860, 8137.

KEPLER, or KEPLER, JOHANN, one of the greatest astronomers of all ages, was born at Magstadt, a small village in Wurtzburg, ten miles from Stuttgart, 27th December 1571. While a mere child he was left to his own resources, and his early education in consequence would have been entirely neglected had he not been admitted into the convent of Maulbronn. K. afterwards studied at the university of Tübingen, and devoted nearly the whole of his time to mathematics and astronomy. In 1593, he was appointed Professor of Mathematics at Graz, and during this time K.'s views of astronomy, as set forth in his Promotuna, were somewhat mystical; he supposed the sun, stars, and planets were typical of the Trinity, and that God distributed the planets in space in accordance with the regular laws by which he had created them. The latter led him to the discovery of the three remarkable truths called Kepler's laws. K., about 1596, commenced a correspondence with Tycho-Bráeh, and in 1599 went to Prague to aid him in his researches. Tycho obtained for him a government appointment, but the salary was not paid, and K. lived for eleven years there in great poverty. He then obtained a mathematical appointment at Linz, and, fifteen years afterwards, was removed to the university of Rostock; but poverty from the same cause still pursued him, and he died shortly after at Ratisbon, 15th November 1630. K.'s connection with Tycho-Bráeh had a salutary effect upon his fiery enthusiasm, and, happily for science, the timid counsels of the old astronomer were overruled, and K. established the law of the diminution of light in proportion to the inverse square of the distance, and was acquainted with the fact, 'that the attractive force of the sun decreases as his light, it is strange that this latter fact did not happen to anticipate the discovery of Newton. In 1600, he published his Astronomia nova, a commentary on the motions of Mars, in which, taking for his law of attraction the law of the sun, K. determined the excentricity and aphelion of this planet, on the supposition of a circular orbit, and found the results quite irreconcilable with observation. This led him to his first law, that the planets move in ellipses with the sun in one of the foci. In second law, that the Radius-vector (q. v.) sweeps over equal areas in equal times, he at first asserted dogmatically, and was for a long time puzzled to find some proof of it (the infinitesimal calculus not having at that time been made use of), but later, after an expedition of dividing the ellipse into an immense number of small triangles, whose areas could be easily found. His third law (the first discovered) was an attempt to harmonise in one way the period and mean distance of the planets, and after twenty-two years of vigorous application, he discovered that the square of the periodic time is proportional to the cube of the mean distance. These discoveries, great as they undoubtedly are, are rendered still more so when we take into account the little real knowledge of the heavenly bodies existing at that time, and the scanty means in the hands of astronomers for making discoveries. K. also affirmed the essential inertia of matter, the first of Galileo's laws of motion; the dependence of the curvature of the path of planets on the attraction of the sun (K. unfortunately thought it was negative attraction) and the proportionality of the mutual attraction of bodies to their masses; he demonstrated the four new planets of Galileo to be satellites of Jupiter; gave a complete theory of solar eclipses; and calculated the exact epochs of the planetary conjunctions of Mercury and Venus across the sun's disc. He also made numerous discoveries in optics, general physics, and geometry.
KERGUELEN'S LAND CABBAGE—KERRY.

The island was discovered in 1772 by the French navigator, Ives Joseph de Kerguelen Tremarec.

KERGUELEN'S LAND CABBAGE (Pringlea antiscorbutica), the only known species of a very curious genus of plants of the natural order Cruciferae, and further interesting as being found at in that most lonely of islands, Kerguelen's Land, and as being extremely useful to the crews of whalers and other vessels which have occasion to touch there. It has a long, stout, rhizomal, root-stock; a balled head of leaves very similar to those of the common garden cabbage. Captain Cook first discovered this plant, and directed attention to it. It is exceedingly abundant in all parts of Kerguelen's Land, which produces only seventeen other flowering plants. The root-stocks have the flavour of horse-radish. The dense white heart of the cluster of leaves tastes like mustard and cress, but is coarser. The whole foliage abounds in a very pungent pale-yellow essential oil, which is confined in vessels that run parallel to the veins of the leaf. The K. L. C. is used by voyagers, boiled either by itself, or with beef, pork, &c., and its antiscorbutic qualities make it very important to them.

KERMAN (ancient Carmans), one of the eastern provinces of Persia, lying south from Kerman, and having an area of about 39,000 square miles. The north and north-east are occupied by a frightful salt waste called the Desert of Kerman, which forms a part of the great central desert of Iran. On this extensive tract, a blade of grass is to be seen. The southern portion, although mountainous, is equally arid and barren with the north, except the small tract of Nirmanshir, towards the east, which is more fertile and watered. Roots are cultivated for the manufacture of 'attar of roses.' Silk and various gums are exported. Cattle, sheep, goats, and camels are reared, and the hair of the last two has long been celebrated for its length and fineness.

The inhabitants, who number about 600,000, are chiefly Persians proper; the rest are Guebres or Parsees, Beluchis, and other wandering tribes.

Kemen, the chief town, is situated near the middle of the province, in the central mountain range, about 30° 45′ N latitude, 56° 30′ E longitude. The manufactures are chiefly shawls, carpets, and matchlocks. The trade, though still considerable, is very small compared with what it was during the last century, when K. was the great emporium for the trade by the Persian Gulf and the Indian Ocean. In 1794, it was taken and pillaged by Aga Mohammed, and 30,000 of the inhabitants made slaves. But the chief cause of the decline of its trade was the fall of Gombrow, only seventeen years before, the rising prosperity of Bushire.

KERMASHAH, a flourishing modern town of Persia, in the province of Ardelan, near the right bank of the river Kerkhah. It is the centre of converging routes from Bagdad, Tehran, and Isphahan. Its commerce is considerable, and there are manufactories of carpets and weapons. Pop. 30,000.

KERMES, sometimes also known in commerce as Scarlet Grain, a dyestuff which consists of the bodies of the females of a species of Cocus (q. v.) (C. ilicis). It has been supplanted over the greater part of Europe by Coccus (C. ilicis), but is the chief source of supply to the south of Europe, and more extensively in India and Persia. The K. insect is abundant in these regions, attaching itself to the leaves of a shrub now of the species of Plantago, but in ancient times of a low bushy shrub with evergreen spiny leaves, much resembling a holly. In some parts of Spain, the K. Oak grows in great profusion, as on the slopes of the Sierra Morena. Many of the inhabitants of Murcia live by collecting Kermes. This is chiefly the employment of women, who scrape the insects from the trees with their nails, which they suffer to grow long on purpose. The K. insect attaches the young ones of the shrub, the female affixing itself and remaining immovable, till, after attaining its full size, about that of a pea, it deposits its eggs, and dies. K. is gathered before the eggs are hatched. It is thrown into vinegar, and afterwards dried in the sun, or in an oven. It has been employed from time immemorial to dye cloth of a blood-Red colour. It was called Tholy by the Phenicians, Coccos by the Greeks, K. by the Arabs. From K. comes the French croumoisit. It is supposed to have been the substance employed in dyeing the curtains of the Jewish tabernacle (Exod. xxvi.).

KERMES MINERAL, so called from its resemblance in colour to the insect, Kermes, is an antimonial preparation which was discovered by the Glanber (q. v.). The method of preparing it subsequently became known to M. de la Ligerie, from whom the king of France purchased the prescription in the early part of the 18th century. It was at that period often described as Carthusian Pouder, or Pouder des Chartes. In consequence, it has been described by chemists as Carthusian red and la Ligerie having effected some remarkable cures by it. Chemists differ slightly as to its composition, but it is generally regarded as a term sulphuret of antimony. K. M. is scarcely ever employed in this country, but it is much used in France and Italy. Its effects are much the same as those of the golden sulphuret (sulphide) of antimony, and of the oxy-sulphuret of antimony of the London pharmacy, it being a sudorific in small doses (half a grain, for instance), and an emetic and purgative in large doses.

KERN, a name applied formerly to Irish and Gaelic infantry soldiers.

KERNER, ANDR. JUSTUS, a German poet, one of the leading members of the so-called 'Swabian School,' was born at Ludwigsburg, in Wurttemberg, 18th September 1756. He studied medicine at Tubingen, and finally settled as a physician at Weinsberg. Here he died, 21st February 1802. He is the most conspicuous writer in the German romantic party. His poetic work is a dreamy fancy and a highly original humour. His chief works are: Reisen und Studien von dem Schatten der Welt (Heidelberg, 1811); Romantische Dichtungen (Karlsruhe, 1817); Der letzte Blütentauscher (Stuttgart, and Tub., 1853). As a physician, he displayed quite a morbid interest in the phenomena of animal magnetism, and wrote several books on the subject, one of which, Die Scharia von Prevorst (2 vol., Stuttgart, 1829; 4th ed., 1846), excited a great interest in America, and is believed to have originated the recent spiritualism.

KERRY, a maritime county in the south-west of Ireland, in the province of Munster, is bounded on the N. by the mouth of the Shannon, and on the W. by the Atlantic Ocean. Area, 1,185,917 acres, of which 414,614 acres are arable, 728,775 acres are uncultivated, and 32,276 are under water. In 1862, the total acreage under crops was 161,062, the half of which was in meadows and pasture, the rest chiefly oats and potatoes. The county is 60 miles in length from north to south, and about 58 miles broad. Its coast-line is about 220 miles in length, fringed with islands, of which the chief are Valentia, the Blasket, and the Skelligs, and is deeply indented by Kenmare, Dingle, and Vally Bays. Between these bays are two peninsulas, occupied by branches of the mountain system, which, stretching westward from the county of
Kersey—Keuper.

Waterford, traverses the whole of the south of Ireland. The principal group is that of Macgillicuddy’s Reeks, the chief summit of which, Carran Tusal, 3414 feet, is the highest in Ireland. The largest rivers are the Lourne, the Maine, and the Cashen. The county contains numerous lakes, some of them, especially those known as the Lakes of Killarney (q. v.), of exquisite beauty. The climate is mild, but moist, especially on the coast. The soil rests on slate and sandstone, with limestone; consists of a rich loam in the central districts, and is productive in grain-crops and in pasture. The manufactures are inconsiderable; oats and butter are the chief exports. The fisheries on the coast are extensive and profitable; they employ nearly 3000 men and boys. K. returns two members to the House of Commons.

Kersey, or Kerseymere, a variety of woollen cloth, differing from ordinary broad cloth by being woven as a twill. See Twill. It is easily distinguished from the common cloth by the diagonal ribbed appearance of its under side, where the nap is not being raised, admits of its structure being seen.

Ketch, previous to 1855, the most important port of the Crimea, with the largest trade in the export of corn, is situated on the eastern shore of the peninsula, on the strait of Kaffa or Yenikale. The town has a distinctively eastern air; and the appearance of the houses is greatly enhanced by the pillars and balconies with which they are furnished. The streets, like those of Constantinople, are haunted by troops of homeless dogs. K., the ancient Panticapaeum or Bosporus, was the capital of ancient Taurica. Previous to 1475, it belonged to the Genoese; subsequently, it came into the hands of the Turks; and finally, in 1774, it was acquired by the Russians. On the 25th May 1855, it was taken by the allies during the Crimean War, on which occasion the Cattacomb, a very valuable collection of antiquities connected with early Greek times, was ruthlessly plundered by the soldiery.

Kestrel, or Windhover (Falco tinnunculus), a small species of falcon, and one of the most common of the British Falconidae. It is rather larger than the merlin, its whole length being from thirteen to fifteen inches. It may be at once recognised by its peculiar habit of hovering or sustaining itself in the same place in the air by a rapid motion of its wings, always with its head to the wind, evidently looking for prey on the surface of the ground. Its prey consists in great part of mice; and although of course included by gamekeepers in the large category of ‘vermin,’ and destroyed on every opportunity, it deserves the most careful protection by farmers, as a check to the excessive multiplication of mice. It more rarely captures small birds, and does not disdain cock-chafers and other insects. It is a very widely distributed bird. The male and female differ considerably in colour; ash-gray prevailing more in the former, and rusty brown in the latter.

Keswick, a market-town of England, in the county of Cumberland, is situated in a charming district on the Greta, at the northern extremity of Derwentwater, 22 miles south-south-west of Carlisle. Manufactures of coarse woollen cloth and blankets are carried on here. In the vicinity, at Borrowdale, black-lead mines are worked; and K. is well known for the black-lead pencils here manufactured. Pop. (1861) 2610.

Kesythe, a market-town of Hungary, in the county of Szalad, is situated on the western shore of Lake Balaton, 90 miles south of Presburg. The breeding of horses is carried on, and there is a good trade in corn. Pop. 7500.

Ketch, a broad, strongly built vessel of two masts—viz., the main and mizen. It is now almost obsolete, but formerly was the favourite form for state yachts. It is, till very lately, was the prevailing mortar-boat. In this latter capacity it was called a bomb-ketch.

Ketcho, or Kesho. See Cacaho.

Ketchup, or Catsup, a name common to several esteemed kinds of sauce, much used with meat, fish, toasted cheese, &c.—Mushroom Ketchup is made from the common mushroom (Agaricus campestris), by breaking it into small pieces, and mixing it with salt—which so acts upon it as to reduce the whole mass to an almost liquid state—straining, and boiling down to a most desirable consistency. Spices of different kinds are added, for which there are many receipts, and sometimes wine. Mushroom ketchup must be kept in tightly-corked bottles.—Walnut Ketchup is made from unripe walnuts, before the shell has hardened. They are beaten to a pulp, and the juice separated by straining. Salt and vinegar are added, also spices variously, and after considerable boiling down, the ketchup is bottled, and may be kept for years.—Tomato Ketchup is made in a similar manner from tomatoes, but is not strained. These are the three most esteemed kinds.

Kettering, a market-town of England, in the county of Northampton, is situated 13 miles north-north-east of the town of that name. The parish church is a large and handsome specimen of the perpendicular style, with a tower, dating from about 1450. The Free School has an endowment of £153 a year. Silk-weaving and plush, and wool-combing are here carried on. Pop. (1861) 5498.

Kettledrum, a drum formed by stretching vellum over the circular edge of a hemispherical vessel of brass or copper. This instrument, which gives forth a sharp, ringing sound, is used by regiments of cavalry and horse-artillery in lieu of the ordinary military drum, which, from its shape, be inconvenient on horseback.

Keuper, the upper division of the Triassic Period, consisting in the typical German series of a thickness of more than 1000 feet of (1) various coloured sandstones; (2) marls, with gypsum and dolomite; and (3) a series of carbonaceous
Kew—Keys.

Kew—Keys.

Kew—Keys.

Kew, a small village in Surrey, on the right bank of the Thames, and six miles west of Hyde Park Corner. On the opposite side of the river is Brentford, with which K. is connected by a turnpike, the most interesting object at K. is the Royal Botanic Gardens, containing a large and choice collection of plants, native and exotic, which have been arranged with much skill and care by Sir W. J. Hooker. The hothouses and conservatories are very numerous. There are also a palm-house, 362 feet by 100, and 60 feet high; a temperate-house, of the same height, occupying three-fourths of an acre; and a museum. The gardens extend over about 75 acres, and the pleasure-grounds connected with them to 240 acres. The Botanic Gardens were commenced by the mother of George III., but owe much of their celebrity to the able management of the present keeper. Since 1840 they have been open to the public in the afternoons, Sundays not excepted. There is also an observatory, which, however, is used chiefly as a meteorological station.

Key, a musical term synonymous with scale, from scala, a stair. The diatonic scale, as produced by nature, is a certain succession of tones and semitones, ascending from any sound taken as a basis to the octave of that sound, the semitones of which will be found to lie between the 3d and 4th, and between the 7th and 8th degrees, ascending from the basis. In rendering this succession of sounds available for musical purposes, by our artificial method of notation, the sounds have, to speak, been fixed at a certain recognised pitch. Any of the sounds of the natural scale may be taken as a note to form the basis of a new scale, observing always the due succession of the tones and semitones. The note forming the basis is denominated the Key-note of the scale, and such scale is said to be in the key of that note. As in our notation, each whole tone can be artificially divided into two semitones (see Chromatic Scale), it follows that, with the already existing systems of notation, there are 362 semitones between a key-note and its octave; and as each of these semitones may be taken as a new key-note, there are therefore twelve keys major, and the same number minor, differing in quality. In written notation, the scale of the note named C has been assumed as the natural key; the notes forming that scale being held to fall naturally into the requisite succession of tones and semitones. It follows that if any other note be taken as the key-note, or more, or all, of the notes of the so-called natural scale must be altered, by being either sharpened or flattened, in order to bring the scale of the new key into the due succession of tones and semitones. Such alteration is indicated by the marks of sharp, flat, or natural placed at the beginning of the staff, and is termed the Signature of the key. In the minor mode, the key of A minor stands exactly in the same relation to the other minor keys as the key of C does to the other major keys, A being the key-note on which the natural minor scale is found. All other keys have sharps or flats, in greater or less number, as they are distant from the natural key of C major or A minor, reckoning by perfect fifths, ascending or descending; thus, the key of G major, which is a perfect fifth above C, has one sharp for its signature—viz., F sharp; the key of D, which is two fifths above C, has two sharps—viz., F sharp and G sharp; and so on to the key of B flat, adding a sharp for every ascending fifth. The keys with flats are found exactly in the reverse order—viz., by descending fifths—thus, the key of F, a perfect fifth below C, has one flat—viz., B flat; the key of B flat has two flats—viz., B flat and E flat; and so on to the key of G flat with six flats, which in practice is regarded as the same as the key of F sharp with six sharps.

The number of flats or sharps is in some cases, for a harmonical purpose, extended still further; such as the key of G sharp with seven sharps, which is the same as D flat with five flats; or the key of G sharp with eight sharps, which is the same as A flat with four flats. The unnecessary increasing of either sharps or flats only increases the difficulty of reading the music. The term key is often loosely used in the sense of mode, and we frequently hear of the major or minor key. Much confusion has arisen from this.

Key West, a city of Florida, United States of America, situated on the island of Key West (Sp. Cayo Hueso, Bone Key), the most southern of the Pinelands, of the group of Florida Keys, 60 miles south-west of Cape Sable. It is a coral island, 6 miles long, 2 wide, and nowhere more than 15 feet above the level of the sea. It has gardens of tropical fruits, and an artificial salt lake of 350 acres. There are extensive fortifications, a good harbour, two light-houses and a light-ship, several churches, a marine hospital and barracks. The city is beautiful, with ornamental cottages and gardens, and is inhabited by army and naval officers, traders, wreckers, divers, and invalids. The exports are salt, turtle, and sponges; but the frequent wrecks among these islands afford the most profitable business, which employs fifty vessels, manned chiefly by Conchas, or natives of the Bahamas Island, and their descendants. The climate is delightful, the temperature being from 80° to 90° F., with perpetual breezes, but there are also violent hurricanes.

Key, Power of the (Potentia Clarissim). In Roman Catholic Theology, properly signifies the supreme authority in the church, which Catholics believe to be vested in the pope, as successor of St Peter. The phrase is derived from the metaphor addressed by our Lord to Peter in Matt. xvi. 19, and some of which Catholic interpreters, relying on the analogous use of the phrase in Isaiah xxii. 22. Apoc. iii. 7
and again i. 18, and also in classical writers, understand as implying the supreme power in the church. The power of the keys is divided by Catholics into two branches—that of order, which, though possessed by all bishops and priests, is believed to belong specially and primarily to the pope; and of jurisdiction, which chiefly regards the supreme government of the church, and empowers the power of enacting laws and dispensing in them, and of directing and governing not only the Christian flock, but also its pastors in their several spheres. The jurisdiction of the keys is exercised in a more limited field, and in a subordinate way by patriarchs, primates, archbishops, bishops, and other dignitaries; but that, according to the Roman theory, it has its source, as well as its chief seat, in the pope, is implied in the distinctive use of the emblem of the keys as a symbol of papal jurisdiction. The technical phrase, 'power of the keys,' is also used in a more restricted sense by Catholic theologians, as applied to the sacrament of penance, in which use it designates the power of remitting or retaining sin. To this more limited sense of the word is also applicable the same distinct order and jurisdiction, of which the former is imparted to every priest by his ordination, while the latter is only communicated by an express act of the keys or their superior.

Protestants in general regard the power of the keys as equally intrusted to the whole ministry of the church of Christ, and as including doctrine and discipline. They admit the argument from the use of the keys as a token of authority; but refuse to acknowledge any limitation of that authority inconsistent with their views of Christian doctrine and of the relation of the ministry to the whole church of Christ, and of Peter to the rest of the apostles.

KEYS, QUEEN'S. In Scotch Law, when a messenger or bailiff executes a caption or warrant under an extract decree, a writ in the former case, or in the latter, that part of the warrant which authorizes him to break open the outer door of the house of the debtor, is called the queen's keys, or letters of open doors. English courts have no power to give a bailiff the right to break open an outer door in executing writs of execution for debt. See House, imprisonment.

KHALKA'S. See MONGOLIA.

KHAN, a title of Mongolian or Tartar sovereigns and lords. A khanate is a principality. Khagan means 'khan of khans,' but has seldom been applied. The word khan is probably of the same origin as king (q. v.).

KHANIA. See CANEA.

KHARASM. See KHYA.

KHAROEH. See EL-KHAROEH.

KHARKOW, a government of Little Russia, immediately east of the government of Poltava. Area, 20,757 square miles; pop. (1858) 1,582,570. The surface is flat, with chalk hills following the courses of the streams. The soil is a rich and fertile loam, watered chiefly by affluents of the Dnipro. In the north-west, the principal occupations are agriculture and distilling corn-brandy; in the south-east, the breeding of cattle and sheep. The breeding of horses is also carried on. Corn, tobacco, wax, honey, and tallow, are largely produced, beet-root sugar is manufactured, and there is an extensive trade in sheep and cattle; but as there is almost no communication with the surrounding governments, the resources of K. may be said to be still in great part undeveloped.

KHARROW, capital of the government of the same name in European Russia, on the banks of three streams, affluents of the Donetz, in lat. 50° N., long. 30° 14' E., 916 miles south-south-east of Petersburg. It has now a population of 45,156, and ranks as one of the chief towns of the Ukraine. Its position between Moscow, Odessa, Kief, Taganrog, and the Caucasus has made it an important market for the exchange of the products of the north and south. The chief trade of the town is affected during the time of the fairs, of which there are four, the principal being the Troitsk fair. The transactions during the fairs amount to about £10,000,000. The staple article of commerce is wool. The town contains seventy factories of various kinds, and manufactured goods are supplied to the surrounding governments. An enormous quantity of wool (value, £1,150,000) is washed here annually. The university of K., founded in 1835, and the other educational institutions, constitute this town the intellectual as well as the commercial centre of the Ukraine.

KHARTOUM, an important town of Africa, the chief centre of trade in Upper Nubia, stands in a sterile district, in lat. 15° 33' N., long. 32° 39' E., at the junction of the Blue and White Nile. Previous to 1847, it was the residence of the governor-general of Egyptian Sudan; it is now the seat of the local government of the province of its title. The principal station of the government are kept here, and there is a government arsenal for the building and repair of boats. The houses are built principally of sun-dried bricks. K. is the centre of many trade routes, conveying caravans to and from consider- able commerce. The imports consist chiefly of Manchester manufactured goods; the exports are ivory, gun-arabic, ostrich feathers, bees-wax, and hides. Pop. 40,000.—See Egypt, the Sudan, and Central Africa, by J. Petherick.

KHATMANDU', the seat of government in Nepal, in lat. 27° 42' N., and long. 85° 18' E. With narrow and dirty streets, and generally mean houses, it contains about 50,000 inhabitants. The architectural pretensions of the town—for even the residence of the rajah is a very ordinary edifice—are confined to its temples, some of them of brick, and the others of wood.

KHAYA', a genus of trees of the natural order Cedrelaceae. The Kasses-Khaya of Senegal (Khany) are the most important of the trees in that part of Africa, attains a height of eighty or one hundred feet, and is much valued for its timber, which is sometimes called Caledra, and is reddish coloured, very hard, durable, and of beautiful grain. The bark is astringent and febrifuge, and contains a peculiar alkaloid.

KHERSON', a government of Southern Russia, on the borders of the Black Sea, first appearing in history during the 4th c. B.C., when it formed a portion of the kingdom of the Bosporans. From the 11th c. the right of possession was claimed by the Pole, the Cossacks, and various Tartar tribes, the last being ultimately successful. In the 17th c., Russians commenced to settle in the province; and during the next century, their example was followed by the Cossacks and a number of Servians, with an area of 28,666 square miles, is uniformly fertile in the north and north-west; in the south it is sometimes dry and arid, with here and there sandy wastes, which towards Odessa become incrusted with salt. Notwithstanding that three large rivers—the Dnieper, Bug, and Dniester—run through the south of the province, the want of water is often severely felt, especially in July, when the vegetation is almost ruined by the heat burned up by the sun. The climate is very changeable, being very hot in summer, and piercingly cold in winter.
KHIERON—KHORASSAN.

ravages by locusts are not uncommon. The population in 1838 was 1,027,439, consisting of Little Russians (natives of the Ukraine), Moldavians, Bulgarians, Greeks, Germans, and Jews, who are chiefly employed in agriculture. The Germans cultivate tobacco, and rear silk-worms. And in the arable land, however, is lost from want both of capital and labour. Cattle and sheep breeding are also carried on, on a large scale.

KHIERON, or CHERSON, capital of the government of that name, in European Russia, lies on the right bank of the Dnieper near to which several outposts of the chief town are placed. It was built by Catherine II. in 1778, as a port for the construction of ships of war; but, in a very few years, was supplanted by Odessa and Nikolaeff, both as a dock-yard and a commercial outlet. Only ships of light draught are now built at K., and only such ships can navigate the estuary. K. is the centre of the coasting and staple trade in timber and other goods, floated down the Dnieper and its tributaries. The trade in Crimean salt. Rope-making, tallow-smelting, and wood-washing, are the chief branches of trade, and the products are largely exported. Pop. (1858) 40,602. K. has a gymnasion, naval school, school for the children of the gentry, and post-office.

KHIVA (anc. Chorazem), KHAUREZM, KHARASM, OR URGUNGE, a khanate of Turkestan, in Central Asia, lies between lat. 37° 45'—44° 30' N., and long. 59° 15'—63° E., and contains about 193,000 square miles (not including that part of the Kizilkum Desert over which the khan arrogates sovereignty). It is bounded on the N. by the Russian territory and Sea of Aral, E. by the khanates of Khokan and Bokhara, S. by Persia, and W. by the Caspian Sea. The chief oasis, in which the capital, Khiva, is situated, stretches from the mouth of the Amu-Daria for 200 miles along its banks, and is watered by canals supplied from that river. Its extent is variously estimated at from 2000 to 4000 square miles, with a population of about 250,000. The dominion race, though not the most numerous, are the Uzbeks. Agriculture is here in a very advanced state, for though the soil is naturally barren, the perseverance and energy of the people have, by means of skilful tillage, irrigation, and the application of manure, converted it into a most productive soil. The principal crops are wheat, barley, rice, potatoes, cotton, flax, and madder, besides the mulberry, vine, apple, and other fruits. Wool, cotton, and linen, are also manufactured. They are exported in great quantities, and also manufactured by the women; and a large trade in these fabrics, but chiefly in agricultural produce, is carried on with Orenburg, Astrakhan, Cabul, and Bokhara, by means of caravans.

K., in ancient times, was nominally subject to the Seleucidae, subsequently it formed a part of the kingdoms of Bactria, Parthia, Persia, and the Caliphate, and became an independent monarchy in 1052 under a Seljuk sultan. The Khwarizmians, or, as they were then called, the Khwarezmians, after conquering the whole of Persia and Afghanistan, were obliged to succumb to the Moguls, under Genghis Khan in 1221. In 1370, it came into the hands of Timur, and was made the headquarters of a vast state, and in 1511 by Shahy Beg (called Sheikhani Khan by western writers), chief of the Uzbeks, a Turkish tribe and his successors still rule over Khiva. In 1717, Peter the Great attempted to conquer it, but his army was totally defeated; the attempt was renewed in 1839 by the Czar Nicholas with the same result; the greater part of the Russian army perished in the desert. But since 1854, when a commercial treaty with Russia was concluded, Russian influence has been gradually obtaining ascendency in the councils of the khan.—KHYVA, the capital of the khanate, is situated in the great oasis, in lat. 41° 40' N., and long. 69° 15'E., and consists almost entirely of earth-huts, not excepting the residence of the khan, the only stone buildings being three mosques, a school, and a caravansery. It is the seat of the trade of the country, and its bazaar is well supplied with English, Russian, and native cloths and peddery, together with groceries and hardware, which are chiefly imported from Russia. Pop. about 13,000.

KHOJEND, a town of Independent Turkestan, on the Sir-Daria, the ancient Jaxartes, about 90 miles north-west of Khokan. It is the seat of some cotton manufactures, and of a considerable transport trade between the Russian dominions and the khanate of Khokan, to which it belongs. Pop. estimated at nearly 30,000.

KHOKAN (originally Kekhan), a khanate of Turkestan, lying east from Khiva. Its area has been estimated at 277,500 square miles, and its population at from 1,500,000 to 2,000,000. On the right bank of the Sir-Daria—the chief river of the khanate—is the city of Khojend, on the left, is an immense sandy waste. The district, however, is various, being rigorous on the heights, and genial in the plains and valleys. K. is famous for its fruits, among which the apricot, apple, pear, ashbon, melon, and water-plant are cultivated. The greatest success, the last-mentioned being specially prized. All the towns and villages are surrounded with gardens; the vine and mulberry tree are everywhere cultivated. Manufactures of silks and coarse cottons are the chief industrial products. Sheep are extensively reared. KHOKAN, the capital of the khanate, is situated on both banks of the Sir-Daria, 230 miles north-west of Cashgar. It is surrounded by a mud-wall, pierced by twelve gates, and enclosed by a ditch. Besides baths and bazaars, the town contains 300 mosques. K. was founded about the middle of the 15th c., and has now a population of 30,000, or, according to Chinese and other reports, of 60,000 or 100,000.

KHolMogO RY, a town in the government of Archangel, European Russia, was a place of great note when the White-Sea trade was in its glory, but since the seat of government has been removed to Archangel, K. has steadily declined, and now contains only 1144 inhabited houses. Its inhabitants are chiefly fishermen. On his return from his travels, brought to K., several specimens of the Dutch breed of cattle, by means of which the natives have so improved their own, that the K. breed is now considered to be the best in Russia.

KHONSA'AR, a town of Persia, in the province of Irak-Ajem, 80 miles north-west of Isphahan, and on the route from that city to Hamadan. Orchards abound here, and the raising of fruit, with weeping, are the chief employments of the people. Pop. about 12,000.

KHORASSAN' (anc. Parthia, Merviana, and Aris), the largest province of Persia, lies between lat. 31°—38° 30' N., and long. 53°—62° 30'E., and contains about 210,000 square miles, of which nearly one-third is a vast salt waste; of the remainder, a large portion consists of plains of shifting sand; and the rest is fertile. The fertile districts are in the north, where the high range of the Elburz and the Caspian Sea have an easterly aspect. There are districts of a mountainous district, abounding with fertile and well-watered valleys. Artificial fertilisation by means of canals was here carried on to a great extent in ancient times, but the incessant disturbances
which have unsettled the district for the last 1000 years, have almost put an end to this practice. The chief products of K. are grain, cotton, silk, hemp, tobacco, aromatic and medicinal plants, fruits, wine, salt, gold, silver, and precious stones, also camels, horses, and asses. In the more thickly-peopled districts, manufactures of silk, woolen, and camels' and goats' hair fabrics, also of muskets and their various parts, are carried on to a considerable extent. The chief towns of the province are Meshed, the capital, Nishapûr, Yezdi, and Astrabad. The inhabitants are Mohammedans of the Shiah sect.

K., in ancient times, also included the desert of Khurasan, and the district known as the kingdom of Herat; but the first was separated from it by the Seldjucks at the commencement of the 11th c., and the latter about 1510, since which period several parts have been seized and held for a short time by the Persians.

K. has been several times separated from the Persian empire, but was finally re-united to it at the commencement of the 10th c. by Ismaïl Soó, the first Sunnite shah of Persia. See Persia.

KHOIABAD. See NINEVEH.

Khosru, or Khûsru, surnamed Nâshîrvan (the noble soul), and known in Byzantine history as Chosroes I., the greatest monarch of the Sassanian dynasty, was the son of Kolbâd, king of Persia. K. mounted the throne on his father's death in 531 A. D., gave shelter to great numbers of those whom Justinian, the Byzantine emperor, persecuted for their religious opinions, in 540 commenced a war of 20 years' duration with the Roman emperor; but though the Persians reaped an abundant harvest of glory, the other results were unimportant. On the accession of Justin II., the Persian ambassador, was immediately discredited, the Greeks having taken possession of Armenia, K., justly indignant, again declared war in 570, took Dara, the eastern bulwark of the empire, but was defeated and run down by the besieging Persians in 579. At the battle of Alqilla (577) by Justinian, grand-nephew of the emperor of that name; this defeat was, however, counterbalanced by the victorious Greek being in his turn totally routed in Armenia. K. did not live to see the end of the contest, as he died in 578. His government, though very despot, and occasionally oppressive, was yet marked by a firmness and energy rarely seen among the orientals. Agriculture, commerce, and science were greatly encouraged, ravaged provinces were repopulated by the conqueror, and he recovered and rebuilt his memory was long cherished by the Persians, and many a story of the stern justice of K. is still current among them. Persia, during his reign, stretched from the Red Sea to the Indus, and from the Arabian Sea far into Central Asia.

(For a full account of this prince, see Sir John Malcolm's History of Persia.)—Khosru II., grandson of the preceding, surnamed Purvis (the Generous), was raised to the throne in 590, but being immediately deposed by another claimant, was, by the assistance of the Emperor Maurice, reinstated, and in gratitude surrendered Dara, Nisibis, and a great part of Armenia, to the Romans. In the winter of 605, upon the capture and despoilment of the capital, K. preserved peace with that nation till the murder of his benefactor by Phocas. K. then invaded Mesopotamia in 614, took Dara, and during 17 years inflicted upon the Byzantine Empire a series of disasters, the like of which they had never before experienced. Syria was conquered in 611; Palestine, in 614; Egypt and Asia Minor, in 616; and the last bulwark of the capital, Chalcedon, fell soon after. At this crisis, the fortune of war changed sides. See Heracleus. K., driven in turn to the very gates of Ctesiphon, was deposed and murdered by his eldest son, Shiravush, or Sirees, 28th February 628. It was to this prince that Mohammed sent a brief letter, recommending a pension to his mission. See Mohammed.

KhuZistan (anc. Susiana), a province of Persia, in lat. 30°-33° 7' N., and long. 47° 45'—51° E., having Fars and the Persian Gulf on the S., is divided into two almost equal portions—the one, the south-west, to the east of the Tigris, is called Khuzistan; the other, the north-east, very lofty, the other, the south-west, so level as to be almost a stagnant sea during the rainy season, changing to an arid waste in summer. K. contains extensive pastoral districts, on which vast herds of cattle are reared and naturally abounds in alluvial soil fitted for such crops as rice, maize, cotton, sugar-cane, indigo, &c. The silk-worm is also reared in some districts. The chief towns are Shuster, Dizful, and Mohammernah.

Kyber Pass, the most practicable of all the openings, four in number, through the Khyber Mountains, is the only one by which cannon can be conveyed between the plain of Peshawur, on the right bank of the Upper Indus, and the plain of Jhelum, in Northern Afghanistan. It is 30 miles in length, and, having a marshy ravine between almost perpendicular rocks of at least 600 feet in height. It may be said to have been the key of the adjacent regions in either direction, in the wars of Alexander the Great to the Afghan wars of 1839—1842. Here a British army, on its retreat from Cabul in January 1842, was absolutely annihilated (see Afghanistan). The gorge is understood to be extremely unhealthy.

Kyburz, a town of Sinde, stands about 15 miles from the Indus, in lat. 24° 30' N., and long. 68° 48' E. The town owes its importance, such as it is, to its having been selected as the residence of the northern Amirs of the country. The place, however, is little better than a collection of filthy mud-hovels, and is estimated to have only 15,000 inhabitants.

Kabou'cca, Kabaou'ca, Kyabouca, or Ambyona Wood, a beautifully moulded wood, which is found in our timber-yards in small pieces, is a very elegant article for cones or excrecences on the stem of the producing tree, Pterocarpus Indicus (natural order Buphaneae). The colour of this wood is yellowish red, of different shades, and covered with a most elegant moulded figure in darker shades. It is equally useful for ornamental frames, and for ornamental articles, especially snuff-boxes, its scarcity and the small size of the pieces forbidding its employment in the manufacture of larger articles.

Kiahta, or Klachta, a town in Siberia, 150 miles south of Lake Baikal, and close to the Chinese frontier, being only separated by a piece of neutral-ground 280 yards broad from the Chinese town of Maimatchin. Resident population only 285.

Through this town began the commercial intercourse between Russia and China, which had been arranged by the treaties of 1689 and 1727. Since the middle of last century, a lively and profitable barter-trade has been carried on both in K. and in Maimatchin; but it was not till the end of the century that the Russians were able to produce on their side any articles besides fur, but since then, cloth and cotton goods, first of English or French, and later of Russian manufacture, have in part been substituted. Formerly, the export to China of coins and bullion was so great as to have been hidden at K., but this restriction is now in part removed. The exports from China consist chiefly of tea, of which about 100,000 cwt. finds its way into Russia by this road. This tea is very dear, on account of the enormous distance it has to be
brought to K. (more than 3000 miles), and the Russian import duty, which amounts to from 40 to 70 kopeks. It is generally impeded by the Russians at 1s. 9d. per lb. But it must not be overlooked that the K. tea is the first crop, immensely superior to all that reaches Europe by any other route.

KIDDERMINSTER, a well-known manufacturing town and municipal and parliamentary borough of England, in the county of Worcestershire, is situated on the Stour, four miles above its junction with the Severn. The parish church is a handsome edifice, partly in the decorated and partly in the perpendicular style. K. is chiefly noteworthy on account of the carpet manufactures which are here carried on. The borough returns a member to the House of Commons. Pop. (1861) 15,399.

KIDNAPPING is not a legal term, but is frequently applied in popular language to the offence of stealing or forcibly carrying off a grown person, in general, now amounts only to an assault or false imprisonment, though formerly punishable with death. Child-stealing, where the child is under 14 years old, is a serious consequence upon or about the person of the child, or to deprive the parent or guardian of the possession of the child, is in England and Ireland a felony, punishable with penal servitude for not less than three, nor more than seven years, or with two years' imprisonment. See also ABDUCTION.

KIDNEY-BEAN (Phaseolus), a genus of plants of the natural order Leguminosae, sub-order Papilionaceae, having nine stamens united by the filaments, and one separate stamen, a downy stigma, a 2-lipped calyx, and the keel of the corolla with the stamens and style spirally twisted. The species are mostly annual herbaceous plants, natives of the warm parts both of the Eastern and Western Hemispheres. The Common K. (P. vulgaris) is the Haricot of the French. In Britain, it is sometimes called French Bean. In the south of Europe, and as far north as Germany, in the United States of America, and many other countries, the K. is a field-crop, and the ripe seeds are an important article of food. Within the tropics, it is sown at all seasons; but in countries subject to frost, only in spring, after the danger of frost is over. The seeds are used for food in a boiled state. In Britain, they are not regularly ripened, except in the most favourable situations in the south. The plant is therefore cultivated chiefly for the sake of the ripe pods, which, when boiled with the young seeds in them, form a well-known and very delicate dish. The Scarlet Runner (P. multiflorus) has often been regarded as merely a larger variety of the K., with long twining stem. It is doubtful, however, if they are originally from the same native country; an American origin being assigned to the Runner, which is also a perennial—although in the climate of Britain usually destroyed by the winter's frost, and therefore treated as an annual—and has tuberous roots. The roots, in common with those of some other species of Phaseolus, are narcotic and dangerous; serious consequences have ensued from the accidental eating of them. The plant is cultivated for the same uses as the K., and affords, even in Scotland, a very abundant crop of green pods in the latter part of autumn, although the seed is not sown till the last of May. It is a very ornamental plant, particularly the common variety with scarlet flowers. It readily covers any trellis or paling, and requires stakes of 6–10 feet in height. Closely allied to the K., if indeed more than varieties, and cultivated for the same uses, are the Haricot de Soissons (P. compressus), the Haricot Princeaux (P. tumulatus), &c. In some parts of India, one of the most esteemed kinds of pulse is the Moog, Moong, or Mungo (P. Mungo); in others, the Kala Moog, or BLACK GRAM (P. Macc).

KIDNEY-VETCH (Anthyllis), a genus of plants of the natural order Leguminosae, sub-order Papilionaceae, containing a number of species, some shrubby, and some herbaceous, natives chiefly of the warmer temperate parts of the Eastern Hemisphere. They have the petals nearly equal in length, and an oval 1–3-seeded pod, enclosed in the permanent inflated and generally downy calyx. The only British species is the Common K. (A. vulgaris), also called Lady's Fingers, a herbaceous perennial, with pinnaed unequal leaves, and crowded heads of yellow (or sometimes scarlet) flowers. It grows on very dry soils, and is eaten with avidity by cattle, but does not yield much produce.

KIDNEYS, the, are two glands having for their office the secretion of the urine. That this office or function is of extreme importance, is sufficiently shown by the facts that if, in consequence of disease, it is altogether suspended in the human subject, even for a day or two, death not unfrequently occurs, and that urinary glands corresponding in function to our kidneys are found, not only in all vertebrate animals, but in almost all molluscs, in the arachnids, in insects, and in myriapods.

The human kidneys are situated in the region of the loins, on each side of the spine, and are imbedded in a layer of fatty tissue. Their form is too well known to require any description. The average length of each kidney is a little more than four inches, and its usual weight is from four to six ounces. The substance of the kidneys is dense, extremely fragile, and of a deep red colour. On making a vertical section of the kidney, it is seen to consist of two different substances, which are named, from their position, the external or cortical, and the internal or medullary substance. The cortical substance forms by far the greater part of the gland, and sends numerous prolongations inwards between the pyramids of the medullary substance. It is soft, granular, and contains numerous minute red globular bodies diffused throughout it, which are called, from their discoverer, the

Vertical Section of the Kidney.
(From Gray's Anatomy.)

a, supra-renal capsule; b, cortical substance of kidney; c, medullary substance of kidney; d, the nerves or plexus; e, the arc-r, proceeding to the bladder.
Malpighian bodies, and which will be presently noticed more fully. Its substance is made up of the uriniferous tubes (which are described in the notice of the medullary portion), capillaries, lymphatics, and nerves, held together by an intermediate parenchymatous substance.

The medullary substance consists of pale-redish, conical masses, called the pyramids of Malpighi. They are usually about twelve in number, but vary from eight to eighteen, and their apices (the papillae) point towards the hollow space (termed the sinus or pelvis) which occupies the interior of the gland. The medullary structure is firmer than the cortical, and instead of being granular, presents a striated appearance, from its being composed of minute diverging tubes (the uriniferous tubes, or tubes of Bellini), which run in straight lines through this portion of the kidneys, after having run in a highly convoluted course through the cortical portion.

The cavity occupying the interior of the kidneys (the sinus or pelvis) is lined by mucous membrane, which, through the middle of the ureter, is continuous with that of the bladder, and which extends into the tissue of the kidneys, to line the uriniferous tubes. The mucous membrane forms a cup-like cavity around the termination of each pyramid, and the cavity, termed the calyx, receives the urine from the open terminations of the tubes, and conveys it towards the pelvis, from whence it passes down the ureter into the bladder.

Each kidney is supplied with blood by a renal artery, a large trunk which comes off at right angles to the aorta. The blood, after the separation of the various matters which constitute the Urine (q.v.), is returned into the venous system by the renal or emissary vein, which opens into the inferior vena cava.

The nerves are derived from the renal plexus, which is formed by filaments of the solar plexus and the lesser splanchnic nerve. They belong entirely to the ganglionic or sympathetic system.

The Malpighian bodies are found in all vertebrate animals. In mammals, which are the only animals in which there is a division into a cortical and a medullary portion, these bodies are only found in the former. In an injected specimen, they appear to the naked eye as mere coloured spots. They are for the most part of a spherical, oval, or flask-like form. Their diameter in man may range from 5th to 14th of an inch, the mean being 10th. A small artery, termed the afferent vessel, may be traced into each Malpighian body, while a minute venous radicle, the efferent vessel, emerges from it close to the point at which the artery had entered. The Malpighian body itself consists of a rounded bunch or tuft of capillaries, derived from the afferent, and terminating in the efferent vessel, and enclosed in a clear and transparent capsule, lined at its lower part with epithelium continuous with that of the uriniferous tube which springs from each capsule.

The convoluted portion of the tube which proceeds from, and is continuous with, the Malpighian capsule, is composed of a delicate basement membrane, and is surrounded externally with an abundant capillary net-work, and lined in its interior by the spongial or glandular variety of epithelium. The diameter of its central canal is about 75th of an inch. The straight portion of the tubes of which the pyramids are composed is shaped like a pyramid, which approaches more nearly to the scaly or tesselated variety, and which seems to serve as a protecting layer, rather than to take part in the function of secretion. The tubes unite with one another to a great degree as they pass through the structure of the pyramids, so that at the base of a pyramid there may be many thousand tubes, while the number of openings at the extremity of a papilla are counted by half a dozen.

It now remains to consider the respective functions of these two essential elements of the kidney (as it exists in the vertebrate animals), viz., the Malpighian bodies and the tubes. From the admirable researches of Mr Bowman (Philosophical Transactions, 1842), and from the labours of subsequent anatomists, it appears that in animals in which the urinary excretion is passed in an almost solid form (as in birds and reptiles), the tubs are small and simple, compared with those in the kidneys of animals which (like man and most mammals) pass the urinary constituents dissolved in a large quantity of water. On these grounds, as well as from the fact, that the anatomical arrangement of the tubs is well adapted to favour the escape of the blood, Mr Bowman arrives at the conclusion, that the function of the Malpighian bodies is to furnish the fluid portion (the water) of the urine. The arrangement of the convoluted portion of the tubes, with a capillary net-work on one side of their basement membrane, and secreting epithelial cells on the other, is the exact counterpart of the arrangement in other secreting glands, and there can be no doubt that the functions of the cells in the convoluted portion of the tubes is to separate from the blood the various organic constituents (area, uric acid, creatinine, &c.) and inorganic salts (chloride of sodium and phosphate of soda, &c.), which collectively form the solid constituents of the urine. It does not necessarily follow that these secreting cells undergo rapid decay and renewal; it is more probable that they have the power of selecting certain materials from the blood, and of transmitting them, without the disintegration of their own structure, to the interior of the tube.

The physical and chemical characters of the secretion yielded by the kidneys will be considered in the article URINE.

DISEASES OF THE KIDNEYS.—The most important affection of the kidneys is Bright's Disease (q.v.), the symptoms of which have already been described. On examining the kidneys, in a case of death from this disease, it is found that the cirrhosis, and great increase in the size and number of the oil-globules which exist in small quantities in the epithelial cells of the healthy gland. The urinary tubes becoming thus gorged and distended, compress the capillary vessels on their exterior; and hence, in consequence of passive congestion of the Malpighian vessels, which gives rise to obstruction of the circulation, the serum of the blood exudes in place of pure
water, and gets mixed with the urine, which thus becomes albuminous in this disease. *Infiammation of the Kidneys,* or *Nephræsis,* is not uncommon. In acute inflammation, there is a deep-seated pain in the small of the back, on one or upon both sides, often extending downward towards the inside of the thigh. This pain is increased by pressure, sudden change of position, coughing, &c. The urine is scanty, high-colored, albuminous, or bloody, and often deposits pus and sedimentary matter on standing. There is more or less fever, preceded by rigors; nausea and vomiting are frequent, and the bowels are usually constipated. In chronic inflammation, some of the above symptoms are present but in a milder form, and there is little or no fever. In both the acute and chronic form, the blood may become contaminated, as in Bright's Disease (q. v.), from the want of due purification by the kidneys, and various secondary affections may arise.

The causes of inflammation of the kidneys are various. It may be due to mechanical violence, exposure to cold and wet, and to the ingestion of substances which have the property of irritating the kidneys, as cantharides, oil of turpentine, &c. A gouty diathesis and the presence of concretions may also be noticed as causes. Any affection capable of producing retention of urine, may, by distending the pelvis of the kidney, occasion inflammation, as, for example, strictures of the urethra and affections of the apical cord producing paralysis of the urinary organs.

The treatment must, on the whole, be antiphlogistic (or lowering) in the early stage of the disease but may be considerably modified in accordance with the origin of the disease.

*Nephritis,* or *Pain in the Kidney without Inflammation,* which usually but not invariably depends upon the passage of a concretion through the ureter, is probably the most painful affection of the human frame is subject. It usually occurs on the day in which the concretion makes its way from the pelvis of the kidney into the ureter, and does not cease till it has passed into the bladder. During an ordinary fit of gravel (see Lithiasis), or even in apparent health, a severe pain is suddenly felt in the loins, extending to the groin, thigh, or abdomen, and sometimes simulating colic. The pain comes on in paroxysms, with intervening periods of complete relief. The paroxysm is usually accompanied by vomiting, a small and feeble pulse, and a profuse sweat. There is a frequent desire to pass urine, but the effort is usually futile. At length, usually after some hours, or even one or two days, the concretion escapes into the bladder, and the pain suddenly ceases.

This affection may be readily distinguished from inflammation by the sudden access and paroxysmal character of the pain and by the absence of fever.

As the disease is one which is very liable to return, the patient should know what steps to take before advice can be obtained. Opium is our sheet-anchor in this affection. The patient (assuming that he is an adult) may take two grains of opium, or an equivalent dose (35 or 40 minims) of laudanum or solution of muriate of morphia, when the attack comes on, and may repeat the medicine in half-doses every hour or two hours, until the pain is somewhat alleviated, or signs of the narcotic influence of the drug are observable. In the meantime, the stomach be so irreparably as to reject the medicine, a draught of laudanum in a little thin starch may be injected into the rectum. Hot fomentations to the abdomen and loins also give partial relief. Chloroform may be inhaled with great benefit during the paroxysms, but only under the superintendence of a physician.

*Suppression of Urine,* or *Ischuria renalis,* is an affection in which there is either a complete cessation of the secreting action of the kidney, or so considerable a diminution as to be clearly morbid. It is undoubtedly, in most cases, a mere symptom of some other disease, but occasionally an independent disorder is obvious, and it must be regarded as an independent or idiopathic affection. If no urine be separated from the blood, coma (intense stupor) and death rapidly supervene from the retention of urea (or of carbonate of ammonia, into which it readily breaks up) in the blood, which thus becomes impure, and acts as a poison on the brain. The treatment, which is seldom successful is too purely professional for notice in these pages.

For further information on diseases of the kidneys and allied affections, see the articles *Bright's Disease,* *Diabetes,* *Dropsy,* and *Lithiasis.*

**KIDRON, or KEDRON.** See Jehoshaphat.

**KIEF,** or **KIEV,** the chief town of the government of that name, on the west bank of the Dnieper, is one of the oldest of the Russian towns, and was formerly the capital. In 964, it was taken from the Khazars by two Norman chiefs, companions of Ruric, and conquered from them by Oleg, Ruric's successor, who made it his capital. In 1240 (when it ceased to be the capital), it was nearly destroyed by Bohemian troops of King Sigismund. It was not restored till the beginning of the 15th century, when it was first proclaimed in Russia at K. in 988. In the 14th c., it was seized by Gedimin, Grand Duke of Lithuania, and annexed to Poland in 1369, but in 1568 was restored to Russia. The K. of the present time is one of the largest towns in the empire, possessing 60,662 inhabitants, one-third of whom are Poles. It is strongly fortified, has a remarkable suspension-bridge over the Dnieper, one of the best in Russia, a university, and a military and an ecclesiastical school. In its neighbourhood is the convent of Kievo-Petchersk, a celebrated Russian sanctuary, which annually attracts thousands of pilgrims from the most remote corners of the empire. K. is not an industrial, but a commercial centre; large fairs take place here annually, the most celebrated of which is the 'Contracts' during the winter, which is attended by all the surrounding proprietors, and by many foreign merchants. The trade is chiefly with Odessa, Poltava, and Astrachan.

**KIEKIE (Freginetis Basilei),** a shrub of the natural order Pandanaceae, yielding an edible, aggregated fruit, said to be the finest indigenous fruit of New Zealand. The species of this genus are mostly tropical Asiatic, and Polynesian tree-leaves, with sheathing, long, rather grassy leaves, usually spinous or serrated on the margin; and terminal, solitary, or clustered spadices of unisexual flowers. The K. is found in the northern part of New Zealand. It clumbs the loftiest trees, branching copiously. The leaves are two or three feet long. The spadices are clustered. The fruit is a mass of fleshy berries. The jelly made of it tastes like preserved strawberries.

**KIEL,** one of the chief towns and most important seaports of the duchy of Holstein, lying on a deep fjord or bay of the Baltic, which admits large ships to anchor close to the town, is situated in lat. 54° 20' N., and long. 10° 7' E. Pop. (1869) 17,000. K. is the seat of the Supreme Court of Appeal for the duchy, and of a university, which was founded in 1665, and has a library of 80,000 volumes, an observatory, a botanic garden, a natural-history museum, and a good collection of northern antiquities. The town is clean and comfortably built. It has two bridges, connecting the northern or older parts with the rapidly increasing southern suburbs. The most ancient of its five churches is St Nicholai, which dates from the 13th century. The castle has a good sculpture-gallery, containing 791.
KIEV — KILDARE.

among other copies of the best works of art, caste, of the Elgin marbles, and of Thorwaldsen’s best productions. The public gardens and the wooded shores of the fjord, together with the woods of Dustermont (where a bathing establishment has existed since 1822), afford numerous pleasant walks. K. has been a member of the Hanseatic League in the 14th c., is still a place of considerable commerce, being the chief mart for the farm and dairy produce of the Danish islands; and the very ancient annual fair, which is held for four weeks after Epiphany, is attended by buyers of all classes from every part of the duchy. K. has manufactures of tobacco, oil-colours, sugar, machinery, ironmongery, &c. It is an important link in the line of communication between Germany and the Baltic islands and ports; and steam-packets daily convey Hamburg passengers and mails to Korsor in Scheland, Christiania in Norway, Gothenburg in Sweden, and several other ports in the Baltic and North Sea.

KIEV, a government of Little Russia, lies immediately north of the government of Kherson, and is bounded on the north-east by the river Dnieper. Area, 19,546 square miles, more than one-half of which is arable, and one-fifth under wood. Pop. (1858) 1,944,344. In the northern portion, the soil is flat and marshy; the south is covered with ranges of hills, branches of the Carpathian Mountains, running from north-west to south-east. The chief river is the Dnieper, with its tributaries, the Priplet and the Teterets. The soil, chiefly loam, and partly clay and sand, is very fertile; so that, although agriculture is backward, the returns are considerable. The climate is exceedingly mild; everything is in blossom in April, and frosts do not set in till November. Agriculture and horticulture are the chief occupations of the inhabitants. Wheat is extensively exported to Odessa. There are numerous distilleries, and beet-root sugar, tobacco, cloth, china, and delft are manufactured. Large cargoes of timber and firewood are floated down the Dnieper to the ports of the Black Sea annually.

KILDARE, Sr, a small island, lying off the west coast of Scotland, in lat. 57° 49' 20" N., sixty miles west of the peninsula of Harris, to the parish of which it is reckoned as belonging. It presents both the most precipitous to the points, one on the south-east, the other on the west side of the island. At each of these points there is a bay with a low shore. Besides the main island, there are several small islets, and the whole group has an area of from 3000 to 4000 square acres. Pop. (1861) 78. Situated in the midst of the Gulf Stream, St K. enjoys a mild climate, although the weather is often boisterous. On the main island, there are eighty or ninety head of black cattle, and nearly 2000 sheep (among which is a Spanish breed, whose wool is highly prized) are grazed on it and on the surrounding islets. Immense numbers of wild-fowl are killed annually, the flesh of which is very generally sold. Before (1860) the feathers sold. The sea abounds in delicious fish, easily caught from the rocky shore without the use of boats. The inhabitants formerly were able to export more or less grain annually; but although the population has decreased within the years, they now consume all the cereal produce of the island, besides an additional quantity, which they import. The present inhabitants habitually consume more corn than they formerly did. They do not receive, nor do they require, any regular gratuitous assistance from the proprietor, as is often represented. The principal exports are wool, woollen cloth, feathers, oil, and salted fish.

KILDARE (Hib. Kild-force, Church of the Oak), a Roman archbishopric and market town in the county of the same name in Ireland, south-west of Dublin. It owed its origin to a monastery, founded, according to the annalists, in the end of the 5th c., by St Bridget, the daughter of an Irish chieftain, who received the veil from St Patrick himself. Around the monastery, a town of some importance sprang up, which, as well as the abbey, was repeatedly plundered by the Danes. After the English invasion, it rose to considerable importance, and a parliament was held in it in 1309. In the wars of Elizabeth, and subsequently in the Great Civil War, it suffered almost complete ruin, from which it but partially recovered. Prior to the Union, K. returned two members to the Irish parliament. At present it is decayed, consisting of but 346 houses, the population in 1851 being but 1298: 331 less than in 1841. The see of K., together with that of Leighlin, in the Protestant Church, is united to that of Dublin. In the Roman Catholic, the united see of Kildare and Leighlin form a distinct dioce. Notwithstanding its present decayed condition, K. is exceedingly interesting for its antiquities, which comprise the ruined cathedral, a Franciscan and a Carmelite abbey, a portion of the chapel of St Bridget, popularly called the 'Firehouse,' from a perpetual fire anciently maintained there, and, above all, the round tower, 130 feet in height, which crowns the elevation on which the town is built, and is seen from a great distance.

KILDARE, an inland county of the province of Leinster, Ireland, distant at its eastern border about 14 miles from the English Channel. Its greatest length from north to south is 40 miles; from east to west, 27 miles. Its area is 481,436 acres, of which 356,787 are arable. Its surface is almost all one unvaried plain, with the exception of the south-eastern border, which meets the range of the Dublin Hills, and the southern border, which likewise is slightly elevated. Its principal rivers are the Liffey and the Barrow, the latter of which in part forms its boundary. The Boyne has its source in K., as has also the Blackwater. It is also traversed by the Grand and Royal Canal. The high road from K. to Dublin is the celebrated road called the 'Curragh of Kildare,'—and undulating down, six miles long, and two broad, the site of the well-known race-course, the Newmarket of Ireland, and 'Bog of Allen.' The solitary hill called Allen, which rises through the great central limestone plain, is a mass of granular, compact, greenstone and porphyry, with a portion of red sandstone conglomerate, which is quarried for mill-stones. The soil is generally a rich loam, resting on limestone or slate. The total extent of land under tillage, in 1853, was 149,837 acres; but since that date, the proportion of pasture-land to tillage has been much increased, the number of acres under cultivation being 133,000. The chief towns are Naas, Athy, and Kildare; but the number of minor towns of considerable business is beyond the ordinary average of Irish counties. In the imperial parliament, K. has two county members, and three representatives in the three historical periods. K. is peculiarly rich. In the time of Geraldus Cambrensis, the plain of the Curragh had a stone circle similar to that of Stonehenge. Of the round tower, there are no fewer than ten examples. Some stone crosses also are still preserved, and there are very many castles of the Anglo-Norman period, three of which are still
KILIA—KILLARNEY.

inhabited. The well-known Roman Catholic college of Maynooth (q.v.) is situated in this county, as is also the Jesuit college of Clongowis Wood.

KILIA, a fortified town of European Turkey, in the province of Bessarabia, is situated on the left bank of the Kilia branch of the Danube, 25 miles north-east of Ismail. Commerce is carried on here to some extent, and there is a population of 6,400.

KILIAN, a saint of the Roman Catholic Church, and Bishop of Wurzburg in the 7th century. He was a native of Ireland, and a member of that distinguished body of Irish missionaries among the Teutonic nations, to whose labours, in the 6th and 7th c., Christianity and civilisation were so largely indebted in the southern and south-eastern countries of Europe. He was of a noble family, and while yet young, entered the monastic life in his native country. Having undertaken, in company with several of his fellow-mons, a pilgrimage to Rome, he was seized in his journey through the still pagan province of Thuringia, with a desire to devote himself to its conversion, and being joined by his fellow-pilgrims, Colman and Donatus, he obtained for the project at Rome, in 687, the sanction of the then pope, Conon, by whom he was ordained bishop. In his return he succeeded in converting the Duke Gosbert, with many of his subjects, and in opening the way for the complete conversion of Thuringia; but having provoked the enmity of Gorlans, who, although the widow of Gosbert's brother, and formerly bound to Gosbert, by declaring the marriage invalid, and inducing Gosbert to separate from her, he was murdered at her instigation, during the absence of Gosbert, in 789, together with both his fellow-missionaries. The work which K. commenced was completed some years later by Boniface and his fellow-missionaries.

KILIMANJARO (the Great Mountain), supposed to be the highest known mountain of Africa, is situated on the western border of Zanzibar, in lat. 3° 40', and long. 36° E. It is covered with perpetual snow, and is supposed to reach an elevation of 20,000 feet above sea-level.

KILKENNY, City or (Gael. ‘Church of St. Kenny, or Canice’), the capital of the county of that name, and a county of itself, is situated on the river Nore, 381 miles south-west from Dublin by the Great Southern and Western Railway. Pop. in 1851, 19,057; in 1861, 14,081 (which shows a decrease of 3894), of whom 12,854 were Roman Catholics. In 1861 there were Established Church, and the rest Protestants of other denominations. The county of the city comprises an area of 7,012 acres, of which 16,091 are external to the city. K. returns one member to the imperial parliament. This city owes its origin to the cathedral church of the diocese of Ossory, which dates from the 12th century. Almost from the time of the invasion, K. was a strong seat of the English power, its castle dating from the time of William, Earl of Pembroke, in 1105. From an early date, K. was a place of much political importance, as well as the seat of numerous religious establishments. Being seated on the southern frontier of the Pale, it was strongly held in the early 14th c., and several parliaments were held in it, of which the most notable was that of 1367, in which was enacted the well-known ‘Statute of Kilkenny’, the great nucleus of all the distinctively English legislation for Ireland. The cathedral dates in part from the 13th c.; and the abbey church of St. John’s, called the Black Abbey, has been partially restored, and is one of the very few ancient Irish churches now in actual occupation for the religious use of the Roman Catholics. A handsome Roman Catholic cathedral also has been recently completed. The so-called college or grammar-school of K. was founded by the Butlers in the 16th c., and was further endowed by the great Duke of Ormond. St. Kyran’s College is an educational establishment for Roman Catholic youth, and is interesting as one of the first opened by that religious community after the repeal of the law which made Catholic education penal in these countries. K. formerly possessed considerable manufactures of blankets and coarse woollen and linen cloths, but of late they have much declined. It is the seat of tolerably extensive marble-works, and has a large and active provision-trade, the chief outlet of which is Waterford, with which K. is connected both by river and by the Kilkenny and Waterford Railway.

KILKENNY, an inland county of the province of Leinster, in Ireland, bounded on the south by the county of Waterford, is 46 miles in its greatest length from north to south, and 24 in its greatest width from east to west. Its area is 796 square miles, or 506,732 acres, of which 470,102 are arable. The population in 1841 was 189,312; in 1851, it was 109,476, of whom 105 were Roman Catholics, 4357 Protestants of t.

Established Church, and the rest Protestants of other denominations. The surface of the county is 'very varied, the southern portion being especially elevated, the range of hills rising to a height of 1696 feet in a conical summit of Mount Brandon. In the western district, are situated the so-called Walsh Mountains. The principal rivers are the Nore, which traverses the entire length from north to south-east, and falls into the Barrow; the Barrow, and Suir, which form the south-western boundary. The surface of K., with the exception of the mountains in the south, is mainly occupied by the limestone formation, overlaid, in the northern districts, by shale and sandstone. In the hilly districts is an extensive deposit of anthracite coal, but of inferior quality. In the neighbourhood of the city of Kilkenny, a valuable black marble, largely interspersed with fossil shells, is extensively quarried, and a considerable manufacture of chimney-pieces, &c., is carried on. Marl is very generally found in large deposits throughout the county. The soil is generally fit for tillage. In 1862, the number of acres under crop was 182,751; 70,370 acres were represented by the poor rate and duties are devoted to pasture. The live-stock of the year 1860 was estimated at £494,107. The capital of K. is the city of the same name (q.v.). The towns of secondary importance are Callan, Thomastown, Freshford, Urlingford, and Castlecomer, which is the centre of the coal district. K. is represented in parliament by two county members, the city having a third member of its own. The county of K. having been, from an early period after the invasion, the seat of the great Anglo-Norman families of Fitzgerald, Butler, Grace, Purcell, and others, has been the scene of much of the conflict of the English and Irish races. It is still thickly studded with the remains of the military strongholds of these English settlers. The ecclesiastical remains are no less numerous; and although not so rich in pagan remains as other Irish counties, it possesses five round towers, and a considerable number of rafts or tumuli, cairns, stone circles, and pillars. The most remarkable natural curiosity is the cave of Dunmore, between Castlecomer and Kilkenny, opening by a natural arch of 50 feet in height, and containing several chambers encrusted with stalactites. It is traversed by a subterranean stream.

KILLA’RENY, a small market-town of Ireland, in the county of Kerry, Munster, is situated on a

The population in 1841 was 189,312; in 1851, it was 109,476, of whom 105 were Roman Catholics, 4357 Protestants of t.
and a half from the Lower Lake of the same name, 17 miles south-east of Tralee, and 46 miles west-north-west of Cork. It contains an imposing Roman Catholic cathedral, and a manuver, has little trade, is exceedingly dull in winter, though it wakes up into animation in spring and summer, when it is visited by crowds of tourists, attracted by the beauty of the scenery in the vicinity. Pop. 5187.

KILLARNEY, LAKES OF, a series of three connected with the centre of the county of Kerry, Ireland. The surplus waters are conveyed by the river Leane north-west to Castlemain Harbours. The Upper Lake is 21/2 miles long and 4ths of a mile broad, and contains several islands. The Long Range River, leading to the Middle Lake, is about three miles in length. The Middle Lake is 2 miles long by 1 mile broad; and the Lower Lake, with about thirty islands, is 5 miles long by 3 broad. The beauty of the scenery, which is widely celebrated, consists in the gracefulness of the mountain outlines, the rich and varied colouring of the wooded shores, deepening through gray rock and light-green arbutus to brown mountain heath and dark firs.

KILCRANKIE, BATTLE OF. See GRAHAM, JOHN, VIOLET; DUNDEE.

KILMAINHAM HOSPITAL, an establishment near Dublin for the reception of wounded and pensioned soldiers. It was originally founded by King Charles II., and is conducted on similar principles to the sister institution, Chelsea Hospital (q. v.). The estimated cost to the country of K. H. for the year 1862–1863 is £3638, and the number of in-pensioners provided for about 130. The general commanding the forces in Ireland for the time being is ex officio the master of K. H., and has his residence on the estate.

KILMARNOCK, the largest town in the county of Ayr, Scotland, and one of the chief stations on the Glasgow and South-Western Railway, is situated on a small stream of the same name, which soon after flows into the river Irvine, 12 miles north-north-east of Ayr. It is long and straggling, extending over a space of nearly two miles, but is, on the whole, well built. K. was once celebrated for its manufacture of "cows"; in the days of hand-loom-weaving, the "Kilmarnock walders" were a notable class, and have received from the satirical pen of Burns a not altogether enviable immortality; but the introduction of machinery has reduced the class to insignificance. Later, the town became (and still continues to be) one of the most important seats of calico-printing in Scotland. It has also several large engineering establishments, woollen mills, tanneries, breweries, &c. The country round about is one of the richest in Scotland in coal and iron. K. is a parliamentary borough, and unites with Rutherglen, Dumbarton, Port-Glasgow, and Renfrew in sending one member to parliament. Pop. (1861) 19,201.

KILORAGAMME. See GRAMME

KILRUSH, a small market and seaport town of Ireland, in the county of Clare, situated on an inlet of the same name, on the northern shore of the estuary of the Shannon, 50 miles west of Limerick. It is much resorted to for sea-bathing, has a good harbour with secure anchorage from westerly gales, and carries on considerable trade in corn, butter, pigs, fish, feathers, hides, flags, Irish moss, and in turf cut in the vicinity. Stone and slate are quarried here, and there are manufactures of flannel, frieze, and linen-sheeting. Pop. (1861) 4555.

KILSYTH, a burgh of barony in Stirlingshire, Scotland, is distant about 12 miles north-east from Glasgow, with which it is connected by railway. There are here several factories, and coal and ironworks. Pop. (1861) 4092.

KILWINNING, a small town in the county of Ayr, Scotland. It consists chiefly of one long, straggling, irregular street. Hand-loom weaving is carried on to some extent, and the place is also noted for its muslin embroidery, which gives employment to several hundred females; but the prosperity of it now depends mainly on the numerous coal-pits in its vicinity, and on its proximity to the Eglinton Ironworks, which alone afford employment to 1700 miners and others.

The parish church, built in 1775, occupies part of the site of an ancient castle. The charter of the town is dated as being the birthplace of freemasonry in Scotland, and until the institution of the Grand Lodge in 1736, all other lodges in Scotland received their charters from 'Mother Kilwinning'; even after 1736, down to 1807, when the two lodges were adjusted, many charters were issued by the mother-lodge. It is also celebrated for its archery, and is the only place in Scotland where the 'Tournament' at the papings is, from 1861, held. About a mile and a half to the south-east of the town, in the midst of extensive and beautiful polders, stands Eglinton Castle, the principal residence of the family of Montgomerie, Earl of Eglinton, and the scene of the renowned 'Tournament' in 1839.

KIMCHI, David (generally quoted by his initials, ReDoK), the most eminent Jewish grammarian and exegete, was born towards the end of the 12th century, at Narbonne, where he spent the greater part of his life. He died in Provence about 1240. His father, Joseph Kimchi, was the author of a number of commentaries and other theological works. His brother Moses is renowned for works of a similar description, more especially his Hebrew Grammar, Mahathah Shelhe la-Daunt, of which there are several editions. His own celebrity, however, far exceeds theirs. His Grammar, Mishchot, and his Lexicon, Skorosonim, have, to a certain degree, been the basis of all subsequent Hebrew grammars and lexicons. He wrote also commentaries on almost all the books of the Old Testament, most of which have been separately printed, and translated into Latin by Dr. Pope, Leusden, Muus, Jansz, &c., besides several poetical works, such as the Tilwach, Teshubab la-Yovan, &c. He was also made arbiter in the great Maimonides controversy (1232).

KIMMERIDGE CLAY, the lowest series of the Upper Oolite, consists chiefly of a bituminous shale, in some places passing into an impure brown shaly coal, and in others having beds of sand or calcareous grit, with layers of nodules of septaria scattered through them. The series attains a maximum thickness of 560 or 600 feet. The beds occur in the vale of Pickering, in Yorkshire, and continue as a narrow band south through Lincoln and Norfolk, then south-east through Huntingdon, Buckingham, and Wilts, to Dorset, where they terminate near Weymouth, and eastward at the village of Kimmeridge, which has given its name to the series. The fossils are chiefly mollusca, with a few placoid and ganoid fish, and several reptiles. In many places, layers of an oyster (Ostrea delibbana), without a shell, or with a slightly crooked and continuous border parallel to the stratification; the valves are usually together, and young specimens are occasionally attached to the older ones.

KIN, NEXT OF. When a person dies intestate, leaving personal property, such property devolves upon and belongs to the next of kin, who are the blood-relatives of the deceased. The law has
declared a certain order of precedence among next of kin, which is not exactly the same in the three kingdoms.

The degrees of kindred are divided into lineal and collateral. The lineal consists of the ascending, such as father, mother, grandfather, grandmother, paternal and maternal, and so on ad infinitum; and the descending, such as son, daughter, grandson, granddaughter, and so on ad infinitum.

The collateral consists of brothers, sisters, uncles, aunts, and the children of such ad infinitum. The mode by which the civil law computed the proximity of degree was this: it allowed one degree for each person in the line of descent exclusively of him from whom the computation begins, and in the direct line counted the degrees from the deceased to his relative; but as regards collateral, it counted the sum of the degrees from the deceased to the common ancestor, and from the common ancestor to the relatives. Thus, a brother was in the second degree, counting one to the father, and one from the father to the brother; a nephew, and also an uncle, a great-grandfather and a great-grandson, were all in the third degree; a son and a father were in the first degree; and so on.

This mode of computing the degrees of kindred has been adopted in the law of England and Ireland.

When a person dies intestate, leaving personal property, there are two classes of persons to which the next of kin are entitled: one is the right to administer the estate; or, to take out letters of administration; the other is the right to a share of the property itself. As regards the right of administration, the collateral of kin is counted, both or either. But among the next of kin, those are to be preferred who are nearest in degree according to the above computation; thus, a son or father is preferred to a brother, grandchild, or great-grandchild; and these to a nephew, uncle, great-grandson, or great-grandfather; and so on. As regards the more valuable right of a share in the property, the rule is, that if there is a widow surviving, and also issue of the deceased, who are in that case the next of kin, then two-thirds of the property go to the next of kin; if there is no issue, but a widow survives, then one-half only goes to the next of kin; but if there is no widow surviving, then the whole goes to the next of kin. But the next of kin take according to the statute of Distributions, which slightly differs from the order of the civil law as to the degrees of priority; thus, the children exclusively take the whole estate, if all the surviving children are dead, leaving issue; or the issue collectively of each dead child take an equal share with the living children, by what is called the principle of Representation. If there are none nearer than grandchildren, all take an equal share, and the issue of a deceased grandchild also take one of such shares. After all the children and grandchildren are dead without issue, then the father, if alive, is entitled to the whole. If he also is dead, then the mother, the living brothers and sisters (together with the issue of deceased brothers and sisters collectively), take each one share. After these are dead, then grandfathers and grandmothers, paternal and maternal, and nephews and nieces, if alive, take each a share. The right of representation, i.e., the right of the children of a deceased person being one of a class (and who, if alive, would have been one of the next of kin), to represent him, and take his share, applies as far as the children of brothers and sisters, but no further. The heir-at-law, if of equal degree, is one of the next of kin, and takes his share with the rest, though he also gets all the real estate. The half-blood counts among the next of kin equally with the whole blood.

In Scotland, the rules of priority among the next of kin vary considerably from the above order which prevails in England and Ireland. The civil law being entitled to an absolute legal share called the heir-at-law, Legitim (q. v.), takes the father's property in two characters—one part as legitimo, the other as being next of kin—and the result is often different from what obtains in England. Moreover, in Scotland, though the heir-at-law may be one of the next of kin, still he can not control the estate of the deceased unless he Collate (q. v.) the heritable estate. The degrees of kindred are not counted in exactly the same way. The father never can take more than one-half, nor the mother than one-third, while any of the brothers and sisters, or their issue, are alive. The half-blood does not share equally with, but in an inferior degree to the full blood.

KINA BALU, an interesting mountain in the northern island of the island of Borneo, reaches a height of 13,000 feet. It was twice ascended by Mr. Spencer St. John, F.R.G.S., author of Life in the Forests of the Far East.

KINIBURN, a small fort of South Russia, in the government of Kherson, is situated at the extremity of a long narrow sand-bank, which forms the southern boundary of the estuary of the Dnieper. During the Crimean war, it fell to the Russian forces on the expedition of the allies, October 17, 1855. About a mile from the fort stands the little fishing-village of Kibarn.

KINCAIDINESHIRE, or THE MEARKS, a maritime county of Scotland, lying between the mouths of the Dee and the North Esk, immediately south of Aberdeenshire. Area, 243,444 acres, nearly one half of which is under culture. The county may be divided into five sections; viz., the Coast, Glen, Garvock, the Grampians, and Deeside. The coast-land and a considerable part of the 'How' is of superior quality, and rents from £2 to £3, 10s. an acre. The 'How' forms part of the Valley of Strathmore (q. v.). The Grampians, running across the county from east to west, parallel to the Dee, with an average breadth of from seven to eight miles, cover about 30,000 acres. One of the peaks, Mount Batstock, on the top of which the three counties of Aberdeen, Kincardine, and Forfar meet, is 3,600 feet high. The Deeside portion of the county is a comparatively narrow strip of light sharp soil. The rain-fall is from 23 to 27 inches. The produce of the county and the condition of the soil, make it one of the richest of the 18th c., when there was little to be seen but poor huts and starved cattle, and when the value of the largest ox of four or five years old, weighing 37 imperial stones, was not more than 20s. In 1837, there were 4,094 acres, averaging 29 bushels 34 pecks; 8,802 acres barley, averaging 33 bushels 3 pecks; 28,174 acres oats, averaging 37 bushels; 17,091 acres turnips, averaging 14 tons 3 cwt. 2555 acres potatoes, averaging 2 tons 19 cwt. Of live-stock there were 4,533 horses, 28,180 cattle, 22,110 sheep, and 3,656 swine. There are few manufactures in the county. The principal towns and villages are Stonehaven (q. v.), the county town; Bervie, a royal burgh; Laurencekirk, a borough of barony; and Johnshaven. In the beginning of the 19th c., about 1 in 50 of the population was on the poor-roll, the average expenditure for each being £1, 16s.; at present there is 1 pauper in 26, and the average allowance to each is £4. 10s. Of the objects of antiquarian interest, the most noted is Dunnottar Castle (q. v.). K. was the birthplace of George Wishart, Robert Barclay, Bishop Burnett, Dr. J. Beattie, and Hughstone Reid. The pop. in 1861 was 34, 465; constituency 1018, who return one member to parliament. 785
KING.—KING-AT-ARMS.

KING (Saxon, Cyning; Sanscrit, Gana, father, from the root Gan, to beget; 'what the husband was in his house, the lord, the strong protector, the king was among his people'—Mozz Moller), is the person vested with supreme power in a state. According to feudal usages, the king was the source from which all command, honour, and authority flowed; and he delegated to his followers the power by which they subordinated the rule in certain districts. The kingdom was divided into separate baronies, in each of which a baron ruled, lord both of the lands, which he held under the obligation of rendering military service to the king, and in many cases also of the people, who were vassals of the soil, and his liege subjects. In modern times, the kingly power often represents only a limited measure of sovereignty, various constitutional checks being in operation in different countries to control the royal prerogative. The king may succeed to the throne by descent or inheritance, or he may be elected by the suffrages of the nation, or by the suffrages of some body of persons selected out of the nation, as happened in the case in Poland. Even when the kingly power is hereditary, some form is gone through on the accession of a new king, to signify a recognition by the people of his right, and a claim that he should pledge himself to perform his duties according to a religious ceremony, in which anointing with oil and placing a crown on his head are included as acts. By the anointing, a certain sacreness is supposed to be thrown round the royal person, while the crown symbolizes his supremacy. There is now no very clearly marked distinction between a king and an Emperor (q. v.). A queen-regnant, or princess who has inherited the sovereign power in countries which have female succession to the throne is recognized, possesses all the political rights of a king.

In England, it is said that the king never dies, which means, that he succeeds to the throne immediately on the death of his predecessor, without the necessity of previous recognition on the part of the people. He makes oath at his coronation to govern according to law, to cause justice to be administered, and to maintain the Protestant Church. He is the source from which all hereditary titles are derived; and he nominates bishops and other officers of state, officers of the army and navy, governors of colonies, bishops and deans. He must concur in every legislative enactment, and sends embassies, makes treaties, and even wars without consulting parliament. The royal person is sacred, and the king cannot be called to account for any of his acts; but he can only act politically by his ministers, who are not protected by the same irresponsibility. A further control on the royal prerogative is exercised by the continual necessity of applying to parliament for supplies of money, which practically renders it necessary to obtain the sanction of that body to every important public measure.

The Crown (q. v.) now in use as the emblem of sovereignty differs considerably in form in different countries of modern Europe; but in all cases it is distinguished from the coronets of the nobility in being closed above. The royal crown of Great Britain, here represented, is described under article Crown. The helmet placed by the sovereign over his arms is of burnished gold, open-faced, and with bars. For the arms of the sovereign, see GREAT BRITAIN.

KING-AT-ARMS, or KING-OF-ARMS. The principal herald of England was at first designated king of the heralds, a title exchanged for king-of-arms about the reign of Henry IV. There are four king-of-arms in England, named respectively Garter, Clarenceux, Norroy, and Bath, but the first three yearly are members of the College of Arms.

Garter principal king-of-arms was instituted by Henry V., 1417 A.D., for the service of the order of the Garter, which had previously been attended by Windsor herald. He was also made chief of the quartered kingdom, or heralds, to which the several heraldic supporters to new peers and knights of the Bath, and to administer the oath to inferior officers of arms, besides performing many other duties connected with the order, and public ceremonies in general. It is necessary that he should himself be an Englishman and gentleman of coat-armour. In the capacity of king-of-arms of the order of the Garter, he has apartments within the castle of Windsor, and a mantle of blue satin, with the arms of St George on the left shoulder, besides a helm and sceptre. His official costume as principal king-of-arms of England is a surcoat of velvet, richly embroidered with the arms of the sovereign, a crown, and a collar of SS. The insignia of the office are borne by Garter impaled with his paternal arms, the latter on the dexter side of the shield. These are argent, St George's cross, on a chief gules a ducal coronet encircled with a garter between two fleurs-de-lis on the sinister side, and a fleur-de-lis on the sinister, all or.

Clarenceux and Norroy are called provincial king-of-arms. Clarenceux takes precedence of Norroy. He has the coronation collar of SS, and a coronet; like the one worn by Garter. The insignia of his office are argent St George's cross, on a chief gules a lion of England ducally crowned or.

Norroy, though he yields precedence to the others, is the most ancient of the king-of-arms. The name first occurs in the reign of Edward II., when he was called Roy des armes des Norroyes, a word used for the present. His official arms are argent St George's cross, on a chief pale azure and gules a lion of England ducally crowned between two fleurs-de-lis on the dexter side, and a key, wards in chief, on the sinister, all or.

Bath king-of-arms, though not a member of the college, takes precedence next after Garter. His heraldic office was created 1725 for the service of the order of the Bath. On the 14th January 1726, he was constituted Gloucester King-of-arms (an office originally created by Richard III, in whose reign it also spent a few years in the hands of Wales). He was at the same time empowered, either alone, or jointly with Garter, to grant arms to persons residing within the Principality.

The chief heraldic officer for Scotland is called Lyon King-of-arms (q. v.), who since the Union has ranked next to Garter. His title is derived from the lion rampant in the Scottish royal insignia.

There is one king-of-arms in Ireland, named Ulster. In the 15th c., there existed a king-of-arms called Ulster, but the office seems to have become extinct, and Edward VI created Ulster to supply the deficiency. His arms are argent, St George's cross, upon a chief gules a lion between a harp and a portcullis, all or. The badge relating to the order of St Patrick, issued 17th May 1833, declares that in all ceremonies and assemblies, Ulster King-of-arms shall have place immediately after the Lyon.

The helm placed by the sovereign over a king-of-arms is of silver gilt and consists of a circle inscribed with the words Missere mei Deus secundum magnam misericordiam tuam, supporting 16 oak leaves, each alternate leaf higher than the rest. Within the crown is a cap of crimson satin, turned up with ermine, and surmounted by a tassel wrought of gold silk.
Kings-of-arms were formerly entitled to wear their crowns on all occasions when the sovereign wore his; now they assume them only when peers put on their coronets. The installation of kings-at-arms anciently took place with great state, and always on a Sunday or festival-day, the ceremony being performed by the king, the earl-marshall, or some other person duly appointed by royal warrant.

**King Crab** (Linotus), a genus of Crustacea, ranked by Cuvier among the Eucroftommatasæ, but so widely differing from all the rest of the Crustaceans, that Milne-Edwards makes it a sub-class by itself. The head and thorax are united together, and are covered by a shield, which is convex above, and concave beneath. The abdomen is more or less hexagonal, no division into rings appears in it, and it is covered by a shield not so broad as that of the head and thorax. On each side it has along the margin six movable spines directed backward and outwards; and attached to it is a tail, which forms a long and strong dagger-like spine, sometimes exceeding in length the whole body of the animal. The legs are not large enough to be visible beyond the shield when the animal moves along the ground. These remarkable animals are found only on the shores of tropical Asia, and the Asiatic Archipelago, and tropical America. They feed on animal food; and are said to be themselves less agreeable food than crabs or lobsters. Some of them exceed two feet in length, and the strong and jagged spine is a formidable weapon. In some of the Asiatic islands, the spine is often used for pointing arrows. In tropical America, the K. is called Conchoco Fish, and the shell is used as a ladle. The number of species of K. is not great.—Fossil species are pretty numerous. Tribolites are supposed to have been allied to the Linotus.

**Kingfisher** (Alcedo), a genus of birds of the order Inavescures, and family Halcyonidae. The name rivaling the finest tropical birds—blue and green being the prevailing colours. The K. is generally distributed over Britain and Ireland, but is not so common in Scotland. It is not a bird of passage, although in many places it appears only as an occasional visitant. It is found in all parts of Europe except the most northern, and over a great part of Asia and Africa. It frequents the banks of rivers and streams, and is often seen flying near the surface of the water. Its food consists of insects, such as minnows, sticklebacks, and trout or salmon fry, and of leeches and water-insects. When it has caught a fish, it often kills it by beating on a branch, and always swallow it head foremost. The indigestible parts are afterwards disgorged. It seems probable, although not quite certain, that the K. is the Halcyon of the ancients, about which many wonderful fables were current among them of its having power to quell storms, of its floating nest, and the stillness of the winds during the time necessary for its safety, &c. Shakspeare makes repeated allusion to the popular notion, that if the stuffed skin of a K. or Halcyon is hung up by a thread, the bill will always point to the direction from which the wind blows.

The Belted K. (Alcedo Halcyon or Ceryl Halcyon) of North America is a much larger bird than the K. of Britain, being fully twelve inches in length. It is not common on the west side of North America, to the 67° N. lat. in summer, but migrates southward in winter, and is then to be found in the West Indies. Its colours are dull when compared with those of the common kingfisher.

Many species of K. are found in the warmer parts of the world. Some of them, forming the genus Ceryl, want the hind toe. The common European K. may be regarded as the type of the family, which belongs to the group called Syngnathinae, and is characterised by the much-united toes. The form is bulky; with long, straight, quadrangular, sharp, heron-like bill, short wings, very short square tail, short legs, and small power to quell storms, of its floating nest, and the stillness of the winds during the time necessary for its safety, &c. Shakspeare makes repeated allusion to the popular notion, that if the stuffed skin of a K. or Halcyon is hung up by a thread, the bill will always point to the direction from which the wind blows.

**King George’s Sound**, an inlet of the Indian Ocean, at the south-west angle of Australia. Independently of an excellent roadstead, it contains two landlocked recesses, Princess Royal and Oyster Harbours. The entrance is in lat. 35° 6’ S., and long. 118° 1’ E.

**Kinglake, Alexander William**, was born at Taunton, Somersetshire, in 1802, studied at Eton and Trinity College, Cambridge, and—having chosen the law as a profession—was called to the bar in 1837. His practice soon became very great; nevertheless, he found time to make a tour in the east of some length, the result of which was a book entitled *Eothen*, descriptive of his adventures and impressions. It was published in 1844, and at once attained an astonishing popularity, passing through many editions both in England and America, and being also extensively translated on the continent. The graceful vigour and liveliness of the style have made *Eothen* a model for subsequent works of a similar kind, but none have yet reached the exquisite talent of the original. In 1857, K. entered parliament as member for Bridgewater. The first two volumes of his *Invasion of the Crimea* have just appeared (1853), and have fully sustained the literary reputation of their author; but the virulent antipathy shewn towards the French emperor and all the actors in the coup d'état is thought to have incapacitated K. from giving a true account of the war, its causes, and the men who were prominent in it.

**Kingpost.** See Roof.
KINGWOOD—KING'S EVIDENCE.

KINGWOOD, a very beautiful wood, in small pieces, used for ornamental work. It is brought from Brazil, and is believed to be the wood of a species of Triplochiton (nat. ord. Leguminoseae, subfam. Mimosoideae). The wood is hard, fine-grained, and light in colour. It is used for the construction of furniture and other ornamental work.

KING'S COLLEGE, Cambridge, was founded in 1441 by Henry VI., for a provost, seventy fellows and scholars, three chaplains, with clerks, choristers, servants, and poor scholars—in all, 140. Its revenues were seriously diminished by Edward IV. The chapel is the work of the three Henrys, VI., VII., and VIII. The architect is supposed to have been Nicholas Cloos, or Klaus, Fellow of the college, and Bishop of Liechfeld, or, as others say, his father. He is perhaps the finest specimen of perpsecticul Gothic in the world. Its internal dimensions are 290 feet long, 45 wide, and 78 high. There is an inner roof of stone, which, though of enormously massive structure, has, from its proportions, and the beauty of the groining, the most airy and pleasing effect. Under the new statutes, which were given in 1861, the foundation will consist of forty-six fellows, and not less than forty-eight scholars, governed by a provost. Twenty-four scholarships will be appropriated to the scholars of Eton College. The fellows under the new statutes will be elected from all members of the college who are of sufficient standing. See Fuller's 'University of Cambridge and Cooper's Memorials.'

KING'S COLLEGE, London, a proprietary institution occupying the east wing of Somerset House, and founded in 1828 on the fundamental principle—'that instruction in the Christian religion ought to form an indispensable part of every system of general education for the youth of a Christian community.' The college being strictly in connection with the Church of England, church service is a regular part of its routine. The course embraces theology, general literature and science, applied sciences, and medicine. A limited number of matriculated students reside within the walls. The museum contains the calculating-machine of Mr. Babbage, and George III.'s collection of mechanical models and philosophical instruments, the latter presented by the Queen. There is a school in connection with the college.

KING'S or QUEEN'S COUNSEL are certain barristers at law, in England and Ireland, who have been appointed by letters-patent to be her Majesty's Counsel. The office is entirely honorary, but it gives a right of precedence in all the courts, according to the date of appointment. The appointment practically belongs to the Lord Chancellor. Though called her Majesty's Counsel, they are not prevented from being retained as counsel for innumerable clients, except that in defending prisoners and acting in suits against the crown, they require a special licence from the crown, which, is however, never refused. In Scotland, there is no distinction of Queen's Counsel, but the Lord Advocate and Solicitor-general are so in reality. The appointment of Queen's Counsel is for life, but in case of disgraceful conduct, the letters-patent are revoked, and as presently done in reference to Edwin James, an English barrister.

KING'S COUNTY, one of the inland counties of Ireland, is bounded on the E. by the county of Kildare, and on the W. by the river Shannon, which separates it from Roscommon and Galway. Area, 493,945 statute acres, of which 337,086 are arable and 8258 in plantations. In 1862, 127,795 acres were under crops, and 1761 acres were lying fallow. Pop. (1851) 112,075; (1861) 99,013. The surface is in general flat; it includes, however, in the southern portion of the Slieve Bloom Mountains, from which a line of low limestone hills extends north-east through the centre of the county, forming a water-shed between the basin of the Shannon and that of the Boyne and Barrow on the east. The soil, a light loam of medium depth, resting on limestone gravel, is of average fertility. The Bog of Allen (q.v.) extends from west to east the whole length of the county. The Grand Canal, reaching from Dublin almost entirely across the country, traverses the north portion of this county. Notwithstanding the great tracts of bog that occur here, the climate is not unhealthy.

Two members are returned to the imperial parliament from this county.

In the north-west of this county are the ruins of the abbey of Clonmacnoise, founded in 548, exceedingly rich in ancient monumental remains, and forming one of the most interesting of those ruined ecclesiastical structures in which Ireland is so rich. The county contains also many other religious foundations, as well as numerous feudal castles, chiefly of the Elizabethan period, and some of them still inhabited.

KING'S EVIDENCE (or Queen's), the term given to a person, who, having been an accomplice in some crime, has confessed, and offered to give evidence, and make full confession. The usual practice of the crown, in such cases, is to pardon the person so acting, though he is not absolutely
KING'S EVIL.—KINGSTON.

entitled to a pardon; and an application is generally made to the judge, to admit the party as a witness, on the trial of the fellow-criminals. A similar practice, in both countries, the public prosecutor having the power and discretion to admit the confessing party.

KING'S EVIL. See SCROFULL.

KING'S LYNN. See LYNN.

KING'S SILVER, an ancient fine paid to the king in the Courts of Common Pleas in England, on alienation of certain lands.

KING'S YELLOW is the term applied to the pigment which is a mixture oforpiment (tarsulphide of arsenic) and arsenious acid.

KINGSLEY, Rev. Charles, was born at Holne Vicarage, Devonshire, 12th June, 1819. He entered Magdalen College, Cambridge, in 1840, where he highly distinguished himself in classics and mathematics. He became a fellow of Magdalen College and theological lecturer about one year after, rector of Eversley, in Hampshire. In the same year, he published Village Sermons, characterised as honest, downright wisdom, conveyed in a plain and simple style. In 1848, appeared The Social Tragedy, or the True Story of Hungary, an admirable and truly catholic representation of mediaval piety. The next two or three years of his life were devoted—in company with his friend Mr Maurice and others—to a series of efforts for the amelioration and christianisation of the working-classes. To these efforts may be traced the origin of those co-operative associations in which the workmen are also the masters, the results of which have proved in every way beneficial. His opinions on the social anarchy of modern times are to be found in his Alton Locke, Tailor and Poet (1849), a novel of extraordinary power and fascination, the hero of which is sought for in a London workshop. This was followed, in 1851, by Yeast, a Problem, in which K. handles, among other questions, the condition of the English agricultural labourer; and in 1853, by Hypatia, or New Foes with an Old Face, a most vigorous and brilliant delineation of Christianity in conflict with rude Gothic paganism and the existing philosophy of Greece, in the early part of the 5th century. Both of these works appeared in Fraser's Magazine. Two years after, he published Westward the Course of Empire Takes Its Run, with the Introduction of Sir Amasa Leigh, Knt., in the Reign of Queen Elizabeth, probably the greatest of his works. Its glowing pictures of South American forests are said to have excited the admiration of Humboldt, who had himself really seen what K. only imagined. His other works are—Message of the Church to Labouring Men; Sermons on National Subjects, preached in a Village Church; Phaeton, or Loose Thoughts for Loose Thinkers; Azamutia and her Schools; Sermons for the Time, Glaucus, or the Wonders of the Shore; The Heroes, or Greek Fairy Tales; Two Years Ago; Good News of God; besides a large number of articles for the magazines. Recently, he was appointed Chaplain to the Queen, and Professor of Modern History in Cambridge.

KINGSTON, chief town of the united counties of Frontenac, Lennox, and Addington, Canada West, lies in lat. 44° 8' 30", long. 76° 30' 1", on the northeast shore of Lake Ontario, at the mouth of the Cataracaui and of the Bay of Quinte; where the waters of Lake Ontario pour into the St Lawrence. Itis distant from Montreal 198 miles; from Toronto, 165; and from New York, 274. A gathering-place of old to the neighbouring Indian tribes, occupied by a French fort from 1673 till 1758, it began to be settled by the British about 1783, was laid out in 1793, was incorporated as a town in 1838, and as a city in 1846. On the union of the two Canadas, the seat of government was established at K. in 1840, but was removed again in 1845. The city has, in consequence, grown more slowly than many others in the New World, but it numbers already among its buildings some of the finest in Canada. Its harbour, served with 17 locks and Garden Islands, which lie two or three miles off, lined with a row of about twenty wharfs, furnished with a grain-elevator capable of unloading 3000 bushels per hour, is always busy, while navigation is open, up to December. In 1863, an improvement of cargoes between the vessels which ply on the lakes and those of the St Lawrence and the Rideau Canal. The ship-building of K. is second in Canada only to that of Quebec. There are five furnnaries in the city, besides works for the manufacture of engines, locomotive and stationary, of agricultural implements, edge-tools, axes, nails, &c.; and it is estimated that these altogether turn out about 9000 tons of finished iron a year. Besides its outlets by water, the city communicates with the rest of the country by the Grand Trunk Railway, which passes within two miles of the city, and is now (1863) connected with it by a branch-line. Next to Quebec and Hamilton, the military position in British America. Queen's University and College at K., incorporated by royal charter in 1841, for the education of a Presbyterian ministry, has since instituted the additional faculties of Law and Medicine. It now equipment with 17 professors and lecturers, and attended by an average of 150 students. There are also a Roman Catholic institution, called Regiopolis College, the county grammar-school, and the common schools, besides several private academies. In 1863, it assumed the seat of the new English bishopric of Ontario. Its population in 1861 was 13,743, who return one member to the provincial parliament. The average value of the yearly exports and imports from 1855 to 1862 has been the following:—

<table>
<thead>
<tr>

KINGSTON, a township and village of New York, U.S., situated on the west bank of the Hudson River, at the terminus of the Delaware and Hudson Canal, 57 miles below Albany. The township contains 3 villages, 18 miles of road, 76 acres of common land, 10 large paper offices, and has a large commerce in coal, stone, ice, lime, and cement. The village was burned in 1777 by Sir Henry Clinton. Pop. (1860) 16,940.

KINGSTON, the commercial capital of Jamaica (q.v.), stands on the north side of a landlocked harbour, the best in the island, and, for its size, one of the best in the world. It was founded in 1693, after the neighbouring town of Port Royal had been destroyed by an earthquake. From this place, afterwards rebuilt, it is separated by its noble haven, while with Spanish Town, towards the interior, it has, since 1846, been connected by a railway of about 10 miles in length. K. contains about 32,000 inhabitants. Though the city, as a whole, is like the generality of rough south-east towns, so disorderly, it yet presents several handsome features. A large square, called the Parade, contains spacious barracks, a Wesleyan chapel, a theatre, and some tolerable dwelling-houses. The negro market for fruits and vegetables is described as a lively and interesting scene. The temperature, which is generally oppressive on the immediate margin of the bay, becomes gradually mitigated towards the head of the sloping streets, which rise into the...
region of the sea-breezes. Most of the trade of
Jamaica passes through K., the harbour of which,
in 1830, received 402 vessels, of which 253 were
British.

KINGSTON, or KINGSTOWN, capital of the
British island of St Vincent, in the West Indies,
stands on the south-west coast, with a population
of about 5000.

KINGSTON-ON-HULL. See Hull.

KINGSTON-UPON-THAMES, a municipal
borough and market-town of England, in the county
of Surrey, is situated 13 miles south-west of
London, on the right bank of the Thames, here
crossed by two handsome bridges, one of stone, and
the other an iron viaduct of the Kingston-upon-
Thames Extension Branch of the London and South-
Western Railway. The county spring assizes are
held in Kingston-upon-Thames. Educational and
beneficent institutions are numerous; there are
flour, cocoa-nut fibre, and oil mills, and brick and
tile works. Pop. (1861) 16,123. Around the King-
ston-upon-Thames Station, on the main line of the
London and South-Western Railway, distant about
a mile, has grown up, since 1838, the elegant
suburb of New Kingston or Surbiton, now almost
joined to the town. In the neighbourhood are
Hampton Court Palace, and Bushy and Richmond
Parks.

Numerous Roman remains have been discovered
in the vicinity of K., and during the Saxon period
it had already risen into importance. Here, in 838,
a great council was held under Eobert of Wessex
and Ethelwo\ke of Kent, and a treaty agreed to;
and here also seven of the Anglo-Saxon kings
were crowned. The name is said to be derived
from the stock on which the ceremony was per-
formed, which stands in one of the streets, enclosed
by a railing.

KINGSTOWN, a thriving and important seaport
of Ireland, on the southern shore of Dublin Bay, six
miles south-east of the city of that name. Previous
to 1817, when the new and splendid harbour-works
were commenced, it was merely a fishing-village.
On occasion of the visit of George IV. to this town
in September 1821, its former name, Dunleary, was
changed to Kingstown. The harbour embraces an
area of 250 acres, with a depth of water varying
from 13 to 27 feet. The pleasing situation of the
town, and the invigorating air, have made K. an
important watering-place. The Dublin Royal Mail
steam-packet sail from K. to Holyhead twice a
day, and there is regular communication by steamer
between it and the principal Irish and British sea-
ports. Coal, iron, and timber are imported, and
cattle, corn, lead ore, and granite, are exported.
In 1861, 1442 vessels of 216,274 tons anchored in
the harbour. Pop. 11,284.

KINIC or QUINIC ACID (\(\text{HO}_2\text{C}_6\text{H}_{12}\text{O}_7\))
is an acid existing in combination with quinia in
the bark of the cinchona.

KINK, a twist in a rope or cord, caused by the
weaving of the yarn, and a relaxation of pressure
in the direction of its length. The best rope,
however, rarely kinks.

KIN 'N \&Oslash; (Cereolus candivolvulus), a quad-
ruped of the family Ursid, and allied to the
dracos and coatis. By some naturalists it is referred
to Viverridae. It has six incisors, one canine tooth,
and five molars in each jaw, the three hinder molars
tuberculous. The K. is larger than a pole-cat, has
a yellowish woolly fur, limbs trees, feeds on fruits,
herb, &c., and well on small animals, and from its
ravages among the nests of wild-bees, is in
some countries called Honey Bear. It is a native of
the warm parts of America. The negroes have
transferred to it the name Porto, from a lemurine
animal of Africa. It is easily tamed.

KINKEL, Johann Gottfried, a German author,
born at Oberkassel, 11th August 1815. He studied
theology at Bonn, and was for some time a distin-
guished Protestant preacher; but becoming involved
in the revolutionary movements of 1848, he was
imprisoned in the fortress of Spaniel, whence, how-
ever, he escaped. K. then went to America, but soon
after returned to England, where he has since resided
as a public teacher. Both as a poet and as a writer
on art, K. holds a distinguished rank. His principal
works are—Predigten über ausgeschiedene Gleichheit
und Bildtreden Christi (Cologne, 1842); Gedichte
(Stutt. 1843); Otto der Schütz, eine Rhein. Geschichte
in zwolf Abenteuern (Stutt. 1843, 9th edit. 1852), a
very beautiful narrative poem; Die Alchimische
Kunst (Bonn, 1845), which forms the first part of a
still unfinished Geschichte der bildenden Künste
bei den Christlichen Vandalen; Die Ahr, Landeschaft,
Geschichte und Volkskunde (Bonn, 1846); Nimrods,
Ein Trauerspiel (Hamb. 1857).—K.'s wife, Johanna
K., a distinguished musician, has written Acht
Briefe über den Clarientunterricht (Stutt. 1849); and
together with her husband, Erzählungen (Stutt.
1849). After her death (in 1859) appeared her
novel, Hans Ibeles in London (Stutt. 1860).

KINNAIRD'S HEAD, a promontory with a
light-house, on the north-east coast of Aberdeenshire,
Scotland, near Fraserburgh, in lat. 57° 42' N., long.
2° W.

KI 'N O, an astrignent substance, resembling
catechu (q. v.) and gambir (q. v.), the concrete
exudation of certain tropical trees, especially of
Pterocarpus marsupium, a native of the mountains
of Coromandel, which yields East Indian K., and
of P. erinaceus, a native of Gambia, which yields
African K. The genus Pterocarpus belongs to
the natural order Leguminosae, sub-order Papilion-
aceae, and has a 5-toothed calyx, and an irregular,
actually orbicular one-seeded pod, surrounded with
a wing.

East Indian K. is the kind which now chiefly
occurs in commerce, and is the ordinary K. or
quina of the shops. It is in small angular
glistering fragments, the smaller reddish, the larger
almost black. Thin pieces are ruby red. It is
brittle and easily powdered, has no smell, but has

Kinkajou (Cereolus candivolvulus)

Kinkajou (Cereolus candivolvulus)
KINROSS-SHIRE.--KIRGHIS.

A very astringent taste. Bengal K. is a similar astringent substance, produced by Butea frondosa. See BUTEA. It has been found capable of the medicinal use of true kino. Botany that K. is the produce of Eucalyptus resinifer. See EUCALYPTUS.

The astringency of kino is mainly due to its containing tannic and catechic acid, and in consequence of this property, it is employed in medicine in certain forms of diarrhea (especially when a flux seems to be kept up by want of tone in the intestinal capillaries), the best mode of prescribing it being as compound kino powder, which is a mixture of kino, cinnamon, and opium, and the dose for an adult ranging from ten grains to a scruple. There is also a tinture of kino, which, when properly diluted with water, forms an excellent gargle for relaxation of the uvula.

Kino is employed to a considerable extent in the East Indies as a cotton dye, giving to the cotton the yellowish-brown colour known as nankeen.

KINROSS-SHIRE, after Clackmannan-shire, the smallest county of Scotland, lies between the counties of Perth and Fife. Area, 49,912 acres; pop. (1861) 7977. Situated 12 miles south of the Firth of Forth, and about 10 miles in breadth. Of its entire area, 30,000 acres are arable, 3000 in wood, and 4500 under water. See Loch Laven. Its surface is elevated and gently undulating, and its boundaries are hilly, with occasional level openings. On the north and north-west are the Ochil Hills; on the north-east, the Monadhills; and on the south-east and south, Benarty and the Cleish Hills.

The streets run in the form of Loch Laven (q.v.,) and are washed by the river Leven. The soil inclines to gravel, but is clayey in the districts north and west of the loch. Excellent pastures occur on the moorlands. For the year 1857, the average produce per imperial acre was: oats, 34 bushels; barley, 31 bushels; turnips, 36 bushels 31 pecks; potatoes, 1 ton 10 cwts. This county unites with, that of Clackmannan, and with portions of Perthshire, in sending a member to parliament. The capital of the county is the town of Kinross, with a population (1861) of 2983, who are employed chiefly in the weaving of tartan shawls, and in spinning, suiting, and dyeing. See KINSALE.

KINSALE, a municipal and parliamentary borough and seaport of Ireland, in the county of Cork, is at the head of Kinsale harbour, which is formed by the estuary of the river Bandon, fourteen miles south-west of Cork. A railway to Cork was opened here on the 16th May 183:; and the foundation-stone of a large marine hotel, with floating baths attached, was laid on the same day. The harbour, which is landlocked, is about two miles long, half a mile in average breadth, and is capable of containing 300 ships. K. exports agricultural produce, and imports coal, iron, and timber; its trade, however, owing to the neighbourhood of Cork, is small. Valuable fisheries, estimated at £1600 per week in value, are carried on in the district. On the Old Head of Kinsale, a promontory stretching southward into the Atlantic, is a light-house, seen from a distance of twenty-three nautical miles. Pop. (1862) 4830.

KINTYRE. See CANTERBURY.

KIOLEN, or KIOLEN, an extensive plateau in Scania county (q.v.).

KIOSK, a small ornamental pavilion, much used in the decoration of the towns, ghats, dams, and other works. It consists of a dome, supported on four or more detached columns, the space under the dome being left open, and the open niches under canopies in Gothic architecture.

KIPTCHA, or KEPTCHAK, a term which, in the middle ages, designated that vast territory stretching, north of the Caspian Sea, from the Don to Turkistan, and occupied by the Kumas and Polovises. This tract formed one of the four empires into which the huge dominion of Genghis Khan was divided, and was the portion of his eldest son Jüly, under whose son and successor, Batâ Khan, it became the terror of Western Europe, and held Russia in iron subjection from 1236 till 1362. Batâ also conquered Bulgaria, and invaded Hungary, Austria, and Eastern Germany, but made no permanent conquests in this direction. This extensive empire was dismembered towards the end of the 15th c., and gave rise to the khanats of Kazan, Astrakhan, and Krim-Tartary. The Mongols of K. were also known as the 'Golden Horde.' Ruins of villages are to be seen in many places, especially near the Volga, and have been visited and described by Pallas, Klaproth, Gobel, &c. They do not partly belong to the era of the K. empire, but many are of more ancient date.

KIRATARJUNIYA, the name of one of the celebrated poems at Wittenberg. The its author is Bhâravi, and its principal subject is the conflict of Arjuna with the god Siva in his disguise of a Kirda, or mountaineer.

KIRBY, REV. WILLIAM, an eminent English naturalist, was born at Wittenham Hall, Suffolk, 19th September 1792. He was educated at Cambridge College, Cambridge, and was afterwards appointed to the curacy of Barham, which he held for fourteen years, when he was preferred to the rectory. This office he held until his death, which happened on the 4th of July 1850, when he had nearly reached the great age of 91. His principal works are Monographia Apum Anglia (Ipswich, 1802), and Introduction to Entomology (4 vols. 1817—1820), published conjointly with Mr Spence. The first was very favourably received both at home and abroad, and at once secured for K. a distinguished place among European savants. The second work is written in the form of letters, and was and still is remarkably popular. K. also contributed a variety of very important entomological papers to the Linnaean Transactions. His greatest discovery in this department of science is that of the genus Buprestis—the type and a new order of insects, living for the most part parasitically on the caterpillars of bees. He also wrote one of the Bridgewater Treatises, entitled Habits and Instincts of Animals. K. was one of the first members of the Linnaean Society (founded in 1788), was a member of the Entomological Society (founded in 1833), and Fellow of the Royal and Geological Societies.

KIRCHENTAG, an association of ministers and laymen of the Lutheran, German Reformed, United Evangelical, and Moravian Churches in Germany, for the promotion of the interests of religion, without reference to their denominational differences. It holds an annual meeting; the place of which is changed from year to year. The first meeting took place in 1848, at Wittenberg, at which Luther affixed his thesis. Its discussions and resolutions have exercised a considerable influence in Germany.

KIRGHIS, or KIRGIS, KASAKI, or KOSAKS of THE STEPPES, a people spread over the immense territory bounded by the Volga, desert of Oshbatchei (in 55° N. lat.), the Irthi, Chinese Turkestan, Ala-Tau Mountains, the Sir-Daria, and Aral, and Caspian Seas. A few tribes of Kalmucks also live within these boundaries. Over this vast tract reigns a dismal monotony; the country has scarcely any important elevation or depression, no river of
consequence runs through it, no great forest breaks the uniformity of the scene; it is a vast steppe, containing 850,000 English square miles, sterile, stony, and covered with rank herbage of five feet high. It abounds in lakes and marshes, the water of which is generally brackish and unseervicable, and in the southern portion lies the Kara-Kum, an extensive salt desert. The K. are a Tartar and the Ural nomad. They are, and have, agricultural, and earn their livelihood from the cultivation of crops and grass. The rest is composed of hilly and mosey ground, and lakes, of which there is one in almost every parish. Some of the hills, one-fourth of which are of granite, are of considerable altitude; amongst which were the country of 2867 feet (Cape 1831 feet); and Cairnsharrow, 1110 feet. There are several considerable rivers, the principal of which are the Cree and the Dee; the latter of which is navigable for two miles above Kirkcudbright.

There are upwards of 400 landowners, many of whom possess small bounds, and farm their own land. One-half of the land is under cultual. The occupant number 1377. The old valued rent was 2345, and the new, last year, was 28666. It became a burgh, and the new, last year, was 28666. It became a burgh, and the new, last year, was 28666. It became a burgh, and the new, last year, was 28666. It became a burgh, and the new, last year, was 28666. It became a burgh, and the new, last year, was 28666.
KIRK-ROAD—KISSINGEN.

are manufactured here, and there are bleaching and printing works, collieries, iron stone mines, and quarries. Pop. (1861) 6966.

KIRK-ROAD, in the Law of Scotland, means a road used by the inhabitants of a district (generally a short cut) for the purpose of going to church. Such a right to a road, if ancient, is recognised as valid in Scotland, and also in England and Ireland.

KIRK-SESSION, in Scotland, &c., the lowest court in Presbyterian churches; being the governing body of a particular congregation, and composed of the 'minister' and 'elders' of the congregation. An appeal may be taken from the kirk-session to the presbytery, and then to the higher courts of the church. Subject to this appeal, the kirk-session exercises discipline in regard to all members of the congregation, suspending from or restoring to the privileges of the church; and questions of this kind must originate in the kirk-session, and be primarily determined there. The functions of the kirk-session were, in former times, too often inquisitorially exercised; but this is now less frequently attempted, and the danger of edictal violence is somewhat diminished, through the growth of an enlightened public opinion. In former times, also, the kirk-session in Scotland often imposed fines, chiefly for offences against the seventh commandment; but this practice had no recognition in civil nor in ecclesiastical law, and is now wholly relinquished. The kirk-session of the Established Church in each parish is fully recognised in Scotch law as having certain rights and duties with respect to the poor, but recent legislation has very much deprived it of its former importance in this relation.

KIRKWALL, a royal and municipal burgh, seat-port, and market-town of Scotland, capital of the county of Orkney, situated on the north-east coast of Mainland, about 20 miles north-west of John O'Groat's House. Its chief building is the cathedral of St Magnus, a fine cruciform structure, in mixed Norman and Gothic, dating from about the year 1138. In the choir of this cathedral, service is still held. Around it are the ruins of the Earl's Castle, the Earl's Palace, and the Bishop's Palace. The town has been greatly improved within recent years. Numerous shops have been established, so that the commercial transactions are now not confined to the island, but have extended to the mainland also. In 1861, 23 vessels of 72,120 tons entered and cleared the port. K. unites with the Wick burghs in sending a member to parliament. Pop. (1861) of parliamentary burgh, 3519.

KIRSANOFF, a town of Great Russia, in the government of Tambow, in lat. 52° 39' N., long. 44° 4' E. Horses and fine-fleshed sheep are reared here, common cloth is manufactured, and there are two annual fairs. Pop. 5665.

KIRCHWASSER (Ger. cherry-water) is a liqueur made from cherries, and highly esteemed in Germany. The cherries, gathered when quite ripe, and freed from their stalks, are pounded in a wood mortar, so that the stones are not broken. They are then left to ferment, and when fermentation has begun, the mass is stirred two or three times a day. The stones are afterwards broken, and the kernels broken and thrown in. By distillation, kirchwasser is obtained. Kirschwasser is sometimes called Cherry Brandy, but the common cherry brandy is made by mixing brandy with the juice of cherries.

KISPALUDY, SANDOR (ALEXANDER), a Hungarian poet, who exercised a great influence on the development of the language and literature of his native country, was born at Sümeg (county of Szolnok), 22d September 1772. He studied at Rab and Presburg, and after serving for five years in the Austrian army, retired to his paternal estate, to devote himself to literature and farming. The first part of his lyrical master-piece, Honfyo Szerelem (Honfy's Love), which appeared in 1806, was received with unbounded applause. K. was spoken of as the 'Great Unknown.' On the publication of the second part in 1807, the author threw aside his mask. In the same year, he published his Poem a Magyar Elmélet (The Romantic Poem of the Olden Time in Hungary), which are marked by depth of feeling, and by elegance and simplicity of style. K. now attempted tragedy, and took Schiller as his model. Some of his historical dramas are worthy of mention, for example, his Jakos Hungaryi, and Luitfades die Koeman. Some of his pieces, illustrating the family life of his countrymen, are among the best on the Hungarian stage. A complete edition of his writings appeared at Pesth, in the years 1832—1835. He died at Sümeg, 30th October 1844.

KISPALUDY, KAROLY (CHARLES), younger brother of the preceding, was born 19th March 1790. He is of greater importance in connection with the development of the Hungarian language than his brother, being regarded as the founder of the national drama. In 1817, he took up his residence in Pesth, and published in rapid succession a series of poems, tales, dramas, and comedies, which secured for him the highest popularity as an author. Of these, his comedies are by far the most valuable. The best of them were translated into German by Gau (Theater der Magyaren, Bonn, 1820). K. died at Pesth, 21st November 1830. The Royal Society of Hungary, so named in honour of the brothers, was established in 1817, and has rendered important services to Hungarian literature.

KISHIM (the ancient Oraeta), an island of Persia, belonging to the Imaum of Muscat, is situated at the mouth of the Persian Gulf, and is about 70 miles in length by 12 in average breadth. It is separated from the mainland by a deep and dangerous strait, in which are several small wooded islets. K. yields in abundance grain, timber, cotton, and vegetables, which were formerly used in the manufacture of cloth. K. is also the seat of the chief cattle. At its eastern extremity is a town of the same name, the capital of the island. Entire pop. estimated at 5000.

KISS, AUGUST, a distinguished German sculptor, was born at Flexa, in Upper Silesia, 11th October 1802. He studied under Rauch at Berlin, and gradually acquired a high reputation, which was greatly increased on the completion, in 1839, of the model of his celebrated colossal group of the 'Amazon attacked by a Panther,' for the execution of which in bronze, now the ornament of the Museum Stairs in Berlin, the sum of 40,000 thalers was subscribed with the greatest enthusiasm on the part of the public. A bronze zinc model of this group was regarded with the highest admiration at the Great Exhibition in London (1851). His 'St George and the Dragon,' which occupied a prominent place at the Paris Exhibition (1855), was much less favourably criticised. Among his other important works are a 'St Michael overthrowing the Dragon,' A Tiger destroying a Serpent,' and a statue of Frederick the Great.

KISSINGEN, a town of Bavaria, in Lower Franconia, celebrated for its mineral works, is situated in the valley of the Saale, 50 miles...
north-north-east of Würzburg. Of its three mineral springs, the Rakoczey and the Pandur furnish saline and chalybite waters, the Mazbrunnen are acidulous and alkaline. A spring called the Soden-Sprudel is remarkable for the periodical ebb and flow of its waters, caused apparently by the accumulation and discharge of carbonic acid gas. The waters are both drunk and used as baths by the patients, and are considered specially efficacious in cases of chronic disease, gout, &c. From 400,000 to 500,000 bottles are exported from K. annually. Since 1848, gaming-tables have been forbidden here by the Bavarian government. Pop. 1826.

**KISTNAH-KITE**

KISTNAH, or KRISHNA, a river of the peninsula of Hindustan, rises within 40 miles of the Arabian Sea, at a height of 4500 feet, in lat. 18° 19' N., and flowing eastward, falls into the Bay of Bengal, after a course of 800 miles. It forms a considerable delta at its mouth. Within the lower or level basin of the stream, artificial means have extended irrigation at an expense of £15,000,000, the principal work being an annient embankment across the stream at the head of the delta. The principal tributaries are the Bhum, the Tungabhadra, and the Musi.

**KIT** in military language, the equipment in necessaries, such as shirts, boots, brushes, &c., of a soldier, but not applicable to his uniform, arms, or accoutrements. Formerly, a high bounty was given, and then severely encroached upon, by making the recruit pay for his kit. As this system led soldiers often to allege that they had been enlisted on a false understanding, the system was changed in 1833, and the fairer principle adopted of issuing a free kit to each recruit, with a smaller bounty. The soldier has still to replace necessaries, worn out or lost, at his own expense, but he obtains the articles at wholesale, and very low prices. As these necessaries are so cheaply procured, it is held a very heavy military offence to make away with them, and is ordinarily punished with great severity.

**KIT, a small narrow-bodied violin, about 16 inches long, capable of being carried in the coat-pocket, and used chiefly by teachers of dancing.**

**KITCHEN-GARDEN** a garden devoted to the cultivation of culinary vegetables, or that part of a large garden which is specially appropriated to this use. As the crops of the kitchen-garden are not generally very pleasing to the eye, care is taken, if possible, that it may not be within view of the principal windows of a manor-house, or otherwise overlooked on notice. But regard must also be had, in the selection of a situation for the kitchen-garden, to exposure, shelter, &c., in which it needs and deserves every advantage that can be obtained. Nor, in order to hide it from view, ought it to be so surrounded with trees as to deprive it either of sunshine or of free access of air.

The general remarks made in the article GARDENING as to soil and the preparation of it, manuring, watering, gardening operations, &c., are all applicable to the kitchen-garden; a part of which, or a place close beside it, is always allotted to compost heaps and the processes connected with them. The successful cultivation of a kitchen-garden requires constant care and labour. Many crops require frequent digging and hoeing during the period of their growth, and the ground must be kept free of weeds as perfectly as in the flower-garden itself. A rotation of crops, and as much intercultural as is practicable in the kitchen-garden as in the farm; cabbages and their congeners, potatoes, leguminous crops, &c., must not from year to year be grown on the same ground. But there are some perennial plants which occupy the same ground for years, as artichoke, asparagus, and sea-kale, and attention must be paid to this in laying out the garden.

The crops cultivated depend, of course, on climate. It will be enough to enumerate here the most important kitchen-garden crops of Britain, referring for further information to each as a separate head. The capitals indicate those most generally cultivated. The varieties of Brassica oleraceae: KALE, CABBAGE, COLEWORTS, SAVOY, BROCCOLE SPRING, CAULIFLOWER, BROCCOLI, Kohli-tabi, &c. POTATO, JERUSALEM ARTICHOKE, TURNIP, CARROT, PARSNIP, RADISH, RED BEET, SKIRRET, SALSIFY, SCORZEDER BEAN, KIDNEY-BEAN, SCARLET-Runner, ONION, LEEK, GARLIC, SHALLOT, ROCAMBOLE, Welsh Onion, SPINACH, White Beet, ASPARAGUS, SAVOY, ARTICHOKE, LETTUCE, CRISSE, MUSTARD, Sorrel, Corn-salad, Endive, CELERY, PARSNIP, HORSE-RADISH, RHUBARB.

Sweet herbs are to be found in almost all gardens, as Thyme, Lavender, Sage, Spearmint, Basil, Marjoram, Savory, &c. The cultivation of the pumpkin, vegetable marrow, and all kinds of gourds, and of the melon and cucumber, is regarded as belonging to the kitchen-garden; which also contains the horses or pots employed for forcing vegetables and fruits. And the hothouses in which fruits are grown for culinary use, are very generally placed in the kitchen-garden. The cultivation of mushrooms, whether in beds or otherwise, belongs to the kitchen-garden.

**KITE** (Milvus), a genus of Falconidae, or a subfamily including Elanets, &c., of which only one species is a common native of Britain, and another is amongst its rarest visitants. The kites have much weaker bill and talons than the falcons and hawks, but the wings are much longer, and the tail is rather long and forked. Their legs are short. They are remarkable for their gracefulness of flight, and power of sailing and wheeling about, or gliding in the air. A Scotch and local English name of the Common Kite (M. vulgaris), GLEAD or Gleed, is believed to be from the same root with gleda. The common K. is found in almost all parts of Europe, the north and centre of Asia, and the north of Africa. It is fully two feet in length, from the tip of the bill to the tip of the tail, the plumage mostly brown, of various shades, in some parts mixed with gray. It feeds on reptiles, mice, rats, and other small quadrupeds, and the young of gallinaceous birds, searching for its prey on the
ground, and often from no small elevation in the air. It sometimes catches fish. In former times, when it was much more plentiful in Britain than now, it was the scourge of poultry-yards, pouncing on young chickens. It was also the scavenger of London and other English towns, devouring the offal, as it still does in some of the towns of Eastern Europe, and performing its office fearlessly even in the midst of the people. This continued to be the case in London to the time of Henry VIII. The K.'s nest is usually in the fork of a tree in a thick wood. It is easily tamed. — A very rare British bird is the Swallow-tailed K. (Sturnus fuscatus), a smaller bird than the common K., abundant in many parts of North America. — The Goivinda K. (M. Goriuida) is common in India. — Other species are found in different parts of the world.

**KITTiwake** (Larus tridactylus, or L. riso), a species of Gull (q. v.), interesting on account of its abundance in very northern regions, and its importance to their inhabitants. In addition to what is stated in the article Gull, it may be mentioned that the young of the K. has dark markings in its plumage which disappear in the adult, is known on

Islington, to be trained for some useful employment abroad. In May 1829, he accompanied Mr Grove and family on a tour to the East, visiting in the course of his travels St Petersburg, Astrakhan, the Kalmuck Turkestan, the Caucasus, and Persia, and Bagdad. He returned to England in 1833. The rest of his life was spent in the service of the book-sellers, chiefly in that of Mr Charles Knight, by whom he was liberally treated. He died at Camnastock, in Wurttemberg, whither he had gone for the benefit of his health, November 25, 1874. His principal works are — *The Pictorial Bible* (1838; new edition by W. and R. Chambers, 1855), *Pictorial History of Palestine* (1829–1840), *History of Palestine* (1843), *Thoughts among Flowers* (1845), *The Lost Sense—Deafness and Blindness* (1845), and *Journal of Sacred Literature* (1848–1893). He also edited the *Cyclopedia of Biblical Literature* (published by A. and C. Black). K.'s biography has been written by Dr J. E. Ryland (1836); a later and better biography is that by Professor Eadie of Glasgow. In 1844, the university of Giessen conferred on him the title of D.D.

**KIUNG-CHAU**, chief city of the island of Hainan (q. v.).

**KIZIL-KEM (Red Sand),** a sandy desert in the north of Turkestan, lying between the Amu-Daria and Sir-Daria, and stretching from the Sea of Aral to Khokan, in lat. 41°–46° 30' N., and long. 60°—69° E. A continuation of this desert northwards across the Sir-Daria is called KARA-KEM (Black Sand) and forms portion of the Kirghis Steppe.

**KIZIL'AR,** a town in the south of Russia, in the government of Stavropol, is situated about 40 miles from the mouth of the river Terak, in lat. 43° 53' N., long. 46° 43' E. It contains a fortress, many vineyards, tanneries, and silk-worm nurseries, and carries on an extensive trade in wine, brandy, and fish. A model vineyard and a school for instruction in wine-making have been established here. The climate is unhealthy. Pop. 8243.

**KLAGENFURT,** a town of Austria, capital of the crownland of Carinthia, is situated on the river Glan, two miles east of the Würther, with which it is connected by means of a canal, and about 80 miles north-north-east of Trieste. It is the seat of the Prince-bishop of Gurk, and has a library of 50,000 volumes. K. has five distilleries, four distilling inks and manufactures woollen, silk, and cotton fabrics. An active transit trade is here carried on.

Pop. 15,000. Here the Hungarian general Görgei has been confined since his surrender to the Russians at Vilagys in 1849.

**KLAPKA, Gyorgy (George),** one of the most heroic and skilful generals of the Hungarian war, is the son of the burgomaster of Temesvar, and was born 7th April 1820. In 1833, he entered the Austrian army, and had attained the rank of lieutenant-colonel when the revolution of 1848 burst out. K. instantly placed himself at the service of the Hungarian government, and took a prominent part throughout the struggle. The plan of the Hungarian campaign in the opening of 1849, which was carried out with such great success, was K.'s work. In several of the battles, the fortune of the day was decided by the troops under his command. But the crowning glory of his services was his escape after the defeat (1849), at the close of the revolution. His famous salvo on the 5th of August was perhaps the most splendid deed of arms in the whole war. The Austrian army besieging the fortress was utterly routed, losing 30 pieces of artillery, 3000 muskets, vast quantities of provisions, and about 2000 head of cattle. K. was
KLAPOTH, Heinrich Julius von, one of the greatest oriental linguists that ever lived, was the son of Martin Heinrich Klaproth, an eminent chemist, and was born at Berlin, October 11, 1783. He betook himself to the study (secretly) of the Chinese language, when only a boy of fourteen, having previously found out that there was a small collection of Chinese books in the public library of Berlin. In 1801, he entered the university of Halle, where he continued for several years. Here he published his Asiatische Magazin, which gave him a high reputation. Having gone to Russia in 1803, in company with his friend, Count Potocki, he was appointed interpreter to the Russian embassy to China. The embassy proceeding nearly 200 miles into Mongolia, was ordered by the Chinese emperor to return, as ‘he did not want to see them;’ but K. took the opportunity of exploring Siberia. He was soon after despatched on a scientific mission to the Caucasus: the results of his valuable explorations are contained in his Reise in den Kaukasus und Georgien den J. 1807 und 1808 (2 vols. Halle, 1812—1814; French, with numerous additions, Paris, 1823). While in Russia, he received many honours. In 1812, he left the Russian service, and returned to Germany; but finally settled at Paris in 1815, where he died, 20th August 1835. K.’s literary activity, especially after 1815, was something prodigious; yet, strange to say, it was accompanied by an excessive love of pleasure, for the gratification which Paris afforded him only too many facilities. His writings relate to the languages and history of the East, more particularly of China, and to the geography of the Russian empire; they are marked by immense learning and extraordinary accuracy, but unfortunately they also contain the most virulent attacks on other scholars. Among his works, we may mention Geographisch-historische Beschreibung des Ossetischen Kaukasus (Weim, 1814); Beschreibung der Russ. Provinzen zwischen den Kaspier und Schwieren Meer (Berl, 1814); Verzeichniss der Chines. und Manischachen Bucher und Manuscripte der Königl. Bibliothek in Berlin (Paris, 1822); Asia Polychlotta (with tables, 1823; 24 edit., Paris, 1829, with a life of Buddha according to the Mongolian legend), a work in which the various Asiatic nations are classified according to the affinities of their languages, and the beginning of their authentic history determined; Tableaux historiques de l’histoire de la Chine depuis la Monarchie de Cumes jusqu’aux jours (4 vols. Paris, 1824—1826, with 24 maps); Mémoires relatifs à l’Asie (Paris, 1834); Collections d’Antiquités Égyptiennes (Paris, 1829); Examen Critique des Travaux de M. Chalméon jeunere sur les Hiéroglyphes (Paris, 1832); Notice d’une Mappe-monde et d’une Composte Chinoise publiées en Chine, l’une en 1730, l’autre en 1793 (Paris, 1833).

KLAUSSENBURG, a town of Austria, capital of the crownland of Transylvania, is situated on the Little Sazanos, 80 miles east-south-east of Graswarden. It is surrounded by old walls, and is divided into the old and the new town. Among its public buildings are a lyceum, a gymnasion, several hospitals and other institutions, benevolent and educational. Woolens, earthenware, and paper are manufactured. The trade of K. is not important. Pop. 19,346.

KLAUSTHAL, a celebrated mining-town of Hanover, on a bleak plateau of the Upper Harz, 25 miles north-east of Gottingen. Situated 1792 feet above sea-level, so that the potato is the chief crop that can be cultivated with success, the inhabitants find their principal employment in the mines and foundries. The ores raised are silver, lead, zinc, copper. 2000 workmen are employed in the mines, and iron, and 1000 in the foundries. In the mint, 14,000 thalers (equal to £2807) are coined weekly. Although the arrangements and apparatus of the mines are very complete, yet their produce has greatly declined, and scarcely repays the management of government, into whose hands they have almost all fallen. Pop. with suburbs 14,900.

KLABA, Count Frantisek, a distinguished general of the French Republic, born 6th March 1753, at Strasburg, where his father was a garden-labourer. Having received a good education, he entered the Austrian army, but returned to France, and ranked as a reserve officer in 1775. He became a major-general in 1787, and a divisional-general in 1792. In 1794, he was made a marshal of France, and in 1804 he was appointed generalissimo of the Army of Italy. In 1805, he was appointed Governor-General of North Italy, and in 1806 he was created a peer of France. He was killed at the battle of Austerlitz, 2nd December 1805.

KLENZE, Leo Chevalier von, a distinguished German architect, was born in 1784, in the principality of Hildesheim, and having studied architecture in Berlin and Paris, was appointed architect to King Jerome of Westphalia in 1808; held a similar commission at the court of Saxony from 1815 to 1839, and in 1833 was raised to the rank of hereditary nobility in that kingdom. In 1834, he was sent to Athens, to superintend the reconstruction of that capital, and in 1839 to St. Petersburg, to execute some works for the Emperor of Russia. Many of the finest buildings recently erected on the continent of Europe are monuments of K.'s genius, such as the Glyptothek, the Panaetorium, the Palaces of the Falhalls, and houses in Munich, the Imperial Museum at St. Petersburg, and several buildings in Athens. He is the author of several works, chiefly on the subject of architecture.

KLEPTOMANIA (Gr. klepto, to steal). Among the ordinary phenomena of mind that are not regarded as insane or criminal are observed inordinate tendencies to acquire, to collect, to hoard. So long as such an impulse does not interfere with the rights and property of others, or involve a great breach of confidence, it is readily admitted as a manifestation of disease, or as an absurdity and eccentricity which may fairly consign the individual to an asylum. —
to contempt, but concerns no one else. But whenever the amount of the object appropriated, or the circumstances under which it is pursued, brings the matter into a court of law, the act is treated as a theft, and punished. In many cases, however, such conduct is the obvious result of disease. The inclination to steal is a premonitory indication of many forms of mental disorder: it is a characteristic symptom of many others, where violence, or delusions, or indifference, leave no doubt as to the source from which it springs. But there are other cases in which the morbid origin cannot be so clearly demonstrated—where the mind is clear and cogent, the morals pure, and where theft is the only proof of insanity. There is evidence, however, in favour of the opinion, that the propensity to acquire may become so irresistible, and the will so impotent, that the appropriation is involuntary, and the perpetrator irresponsible. The gratification of the impulse is found associated with physical changes and conditions which may be regarded as incommensurate with the healthy discharge of the functions of the nervous system; but the connection is not invariably, and the best mode of establishing the reality of such a disease is to consider marked cases in the circle of known characters, in the pre- and previous deportment of the individual—to the nature of the articles taken—and to the motives which seem to have determined the action. A baronet of large fortune stole, while on the continent, pieces of old iron and of broken crockery, and in such quantities, that tons of these collections were presented to the custom-house officers. A clergyman of respectable bearing and great usefulness abstracted from book-shops several hundred volumes of the Bible, perhaps with the intention of distribution. A physician pocketed some small object whenever he entered the apartment of a patient; another member of this profession stole nothing but table-cloths. The incongruities in such narratives point to the existence of deep-seated unhealth. Although each case must be tested on its own merits, there are various features, common to a number of even doubtful cases, which should be embraced wherever a judgment is formed. The objects are often stolen ostentatiously, or without any adequate precautions to conceal the attempt; they are of no value in themselves, or useless to the thief; the act is solitary, independent, without motive, and proceeding from a sense of excitement, as if looked, repeated. The article acquired is restored, or altogether disregarded; and although money is rarely taken, bright and coloured objects most generally excite caprice. It is observed in extreme youth; it is associated with pregnancy; it is hereditary; and often follows affections of the brain, and those critical and crucial changes in disposition which are only explicable on the supposition of corresponding alterations in the organisation.—A Manual of Psychological Medicine, by Drs Bucknell and Tuke, pp. 224 et seq.; Ann. Med. Psychol., t. v. p. 666 (1853).

KLIAZMA, a river of Russia, an affluent of the Oka, rises in the government of Moscow, and flows east through the city of Vladimir. K.-Novgorod joins the main stream near the town of Gorobat, after a course of 327 miles, for the last 150 of which it is navigable. Passing through the most industrial governments of Russia, it is one of the principal arteries of the empire.

KLINKET, a term in Fortification, signifying a small postern or gate in a palisade.

KLOPSTOCK, FRIEDRICH GOTTLIEB, a German poet, was born 2d July 1724, at Quedlinburg, and went to Jena in 1745, to study theology. He had already formed the resolution to write a great epic poem, and thought of Henry the Fowler as a good subject for one, and at Jena composed the first cantos of his Messiah. In 1746, he passed to Leipsic, and there became acquainted with the editors of the Brescische Beiträge, in which the first three cantos of the poem appeared in 1748. They attracted great attention: the author was pronounced a religious poet of the highest order. He was now invited to Copenhagen, upon the recommendation of the minister Bernstorff, and introduced to the king, whom he accompanied on his travels. In 1771, K. settled in Hamburg, with a sinecure appointment and a pension from the Danish government, and subsequently received an honorary title and a pension from the Markgraf, afterwards Grand Duke, of Baden. In 1774, the last five cantos of his Messiah were published at Halle. He died 14th March 1803. K.'s name has (or rather perhaps had) a very high place in German literature. Whatever may be thought of the intrinsic value of his poetry, it cannot be denied that he exercised a very important and beneficial influence on the national taste. The greatest of his successors, Goethe, acknowledged this, though he also expressed the opinion, that K. is at least that his conception of poetry had become so. When K. first began to write, the literature and social life of Germany were penetrated by French influences. A cold, correct, unimaginative spirit tyrannised over the thought and habits of the people. K. broke loose at once from this shallow despotism, and breathed the air of Freedom into German poetry. Odes, tragedies—in which he introduces Hermann (q.v.), the Cheruscan as a national hero—and biblical dramas, with some hymns, which still find a place in collections, constitute the remainder of K.'s poetry. His works were collected and published in 12 vols. (Leip. 1793—1817), in 18 vols. (1825—1829), in 9 vols. (1839). The Messiah has been translated both into verse and prose in English.

KNAPP, ALBERT, a German poet, author of many of the best modern German hymns, is a native of Würtemberg, and was born in 1798. He studied for the church, and is now the principal clergyman in Stuttgart. K. has breathed a new life into that long-neglected branch of poetry—the religious hymn. Many of his effusions are to be found in the Christianisches Gesangbuch of his father-in-law, which appeared in 1833. His Christliche Gedichte, in 2 vols. (Stuttg. 1829; 3d edit. Basel, 1843), to which a third was added under the title of Neure Gedichte (Stuttg. 1834), were published by his friends. His later hymns are contained in his Gedichte (Stuttg. 1843). K. is equally distinguished as a hymnologist. His Evangelisch-Quartett für Kirche und Haus (2 vols. Stuttgart und Tübingen 1837; 2d edit. 1859) is one of the most valuable collections of Christian hymns of all ages, to which his Chorale Leiter (Stuttg. 1841) forms a splendid supplement. His Hohenstenfien (Stuttg. 1839) is a cycle of religious songs and poems.

KNAP'SACK, a bag of canvas or skin, containing a soldier's necessities, and worn suspended by straps between his shoulders. Those used in the British army are ordinarily of black painted canvas, but some other nations, as the Swiss, make them of thick goat-skin, dressed with the hair on. The knapsack affords by far the easiest way of carrying light personal luggage during a march or walking-tour.

KNAPWEED. See CENTAUREA.

KNARESBOROUGH, a parliamentary borough and market-town of England, in the West Riding of Yorkshire, on the left bank of the Nidd, 18 miles
Knaveship—Knight.

The Knee, or knee-joint, is a hinge-joint, namely, flexion and extension, but it is also capable of slight rotary motion when the knee is half-flexed. During flexion, the articular surfaces of the tibia glide backwards upon the condyles of the femur; while in extension, they glide forwards. The whole range of motion of this joint, from extreme flexion to extreme extension, is about 150°. Judging from its articular surfaces, which have comparatively little adaptation for each other, it might be inferred that this was a weak and insecure joint; and yet it is very rarely dislocated. Its real strength depends on the large size of the articular ends of the bones, on the number and strength of the ligaments, and on the powerful muscles and fascia by which it is invested.

Knaveller, Sir Godfrey, an eminent portrait-painter, was born at Lübeck in 1648, and studied painting under Rembrandt and Peter Paul Rubens. He at first chose historical subjects, but afterwards gave himself entirely to portrait-painting. In 1674, he went to London, and, on the death of Sir Peter Lely in 1680, was appointed court-painter to Charles II. In 1684, he visited Paris, at the invitation of Louis XIV., and painted portraits of the king and royal family. He retained his office at the English court during the reign of James II., and continued to till it after the Revolution. In 1689, William III. bestowed on him the honour of knighthood, which he afterwards received also from the Emperor Joseph I.; and in 1715, George I. made him a baronet. He died in 1725, or, according to others, in 1726, and a monument was erected to him in Westminster Abbey, with a highly laudatory inscription by Pope. K.'s best-known productions are the 'Beauties of Hampton Court' (painted by order of William III.), and his portraits of the 'Kit-Cat Club.' He painted avowedly for the love of money, and hence never did justice to the talent he possessed, so that it is difficult for posterity to understand his reputation.

Knight, Charles, an eminent English publisher and author, was born in 1791, at Windsor, where his father carried on the business of a bookseller, and was brought up to the profession, but early turned his attention to publishing. Among his first attempts in this department was The Elegant, a periodical supported by the Eton boys, and which—in spite of its juvenility—obtained a considerable reputation. He next started (1821) Knight's Quarterly Magazine, and continued it for some time in London, to which he removed in the following year. The whole of his long and honourable career has been devoted to the cause of popular literature, of which he was one of the earliest and most accomplished advocates. Among the works which he has published or edited are the Penny Magazine (1832—1845), which was started only a month or two after Chambers's Edinburgh Journal, and at one time enjoyed a circulation of nearly 200,000 copies weekly; the British Almanac, and Companion to the Almanac; Penny Cyclopaedia (30 vols. 1833—1836); Library of Entertaining Knowledge—the volume on the Elephant (1831) being written by himself; Pictorial History of England (now the property of the Messrs. Chambers, who published an 'improved edition' in 1835); Pictorial History of the Reformation in England (1838); Pictorial History of the Wars of the French Revolution (1857); London Pictorial Illustrations (6 vols. 1841—1844); Old England, a Pictorial Museum of National Antiquities (2 vols. 1845); Half-hours with the Best Authors (4 vols. 1847—1848); The

Internal view of the Right Knee-joint.

\[ a, \] the A. sur.; \[ b, \] and \[ c, \] the internal and the external condyles; \[ d and \; \] the two cruciate ligaments; \[ f and \; \] the external and internal semilunar cartilages; \[ k and \; \] the upper part of the \[ feline; \] \[ f, \] the upper part of the tibia.

ligament; and a capsular ligament, which surrounds the joint in the intervals left by the preceding ligaments. The positions of these ligaments are sufficiently indicated by their names. Of the internal ligaments, the two crucial, so called because they cross one another, are the most important. Their position is shown in the figure. The external and internal semilunar cartilages are usually placed amongst the internal ligaments; they are two crescentic plates of cartilage. The outer part of each cartilage is thick; the inner free border thin. Each
Land we Live in (4 vols. 1848); Cyclopædia of the Industry of all Nations (1851); and The English Cyclopædia (24 vols. 1854—1861), which is based on the Penny Magazine, but is a great advance even on that admirable work, and, in fact, forms one of the most complete and accurate cyclopaedias in the world. K. has, in addition, won a highly respectable position as an author by his Pictorial Shakespeare, which is accompanied by a 'Biography' and 'History of Opinion, with 'Doublful Plays,' &c. (8 vols. 1839—1841); library edition (12 vols. 1842—1844); national edition, with 'Biography' and 'Studies' (8 vols. 1851—1853), Life of Caxton (1844); Poems and Poems, with Glossarial Notes (17th. ed. 1857), Knowledge of the Times, an Illustrated History of England, an Illustrated History of Society and Government from the Earliest Period to our own Times (1856—1862). This work is probably the very best history of England that we possess—'the Times,' according to the Times, 'for English youth.'

KNIGHTS (Saxon, Cniht, a servant or attendant), originally men-at-arms bound to the performance of certain duties, among others to attend their sovereign in feudal times of war. The institution of knighthood, as conferred by investiture, and with certain oaths and ceremonies, arose gradually throughout Europe as an adjunct of the feudal system (see FEUDAL System, CHIVALRY). The characteristic of knighthood was at once military and religious. The defence and recovery of the Holy Sepulchre, and the protection of pilgrims, were the objects to which, in the early times of the institution, he especially devoted himself. The institution of knighthood was introduced into England by William the Conqueror, endowed the king, or even a superior lord who was a subject, to compel every holder of a certain extent of land to serve in the wars of the realm, and to maintain a certain number of the knightly order; his investiture being accounted proof that he possessed the requisite knightly arms, and was sufficiently trained in their use. The 'Statute of Knights,' of the first year of Edward II., regulating the condition that were to be held valid to excuse a man from knightly service, shows that in the 14th c. the knightly office was not always eagerly coveted; yet its social dignity was very considerable, for even dukes, if not invested in the orders of chivalry, were spared in the year of precedence in any royal pageant or public ceremony. In time of war, each knight was bound to attend the king for forty days, computed from the day when the enemy arrived in the country. After the long war between France and England, it became the custom for the sovereign to receive money compensations from subjects who were unwilling to receive knighthood, a system out of which grew a series of grievances, leading eventually to the total abolition of knight-service in the reign of Charles II.

Knighthood, originally a military distinction, came, in the 16th c., to be occasionally conferred on civilians, as a reward for valuable services rendered to the crown or community. The first knight in England was Sir William Walworth, lord mayor of London, who won that distinction by slaying the rebel Wat Tyler in presence of the king. Since the abolition of knight-service, knighthood has been conferred without any regard to previous mark of the sovereign's esteem, or a reward for services of any kind, civil or military. In recent times, it has been bestowed at least as often on scholars, lawyers, artists, or citizens, as on soldiers, and in many cases for no weightier service than carrying a congratulatory address to court.

The ceremonies practised in conferring knighthood have varied at different periods. In general, fasting and bathing were in early times necessary preparatives. In the 11th c., the creation of a knight was preceded by solemn confession, and a midnight vigil in the church, and followed by the reception of the eucharist. The new knight offered his sword on the altar to the Bishop, and a prayer in church, and determination to lead a holy life. The sword was redeemed in a sum of money, had a benediction pronounced over it, and was guided on his shoulder by the highest cleric in whose presence the knighting took place. The knighting was conferred by binding the sword and spurs on the candidate, after which a blow was dealt him on the cheek or shoulder, as the last affront which he was to receive unremittingly. He then took an oath to attend the duties of a knight and to maintain, and never by word or deed to stain his character as a knight or a Christian. A knight might be degraded for the infringement of any part of his oath (an event of very rare occurrence), in which case his spurs were chopped off with a hatchet, his sword broken, his escutcheon reversed, and some religious observances were added, during which each piece of armour was taken off in succession, and cast from the recent knighting.

It has been stated that knighthood could originally be conferred by any person of knightly condition, but if so, the right to bestow it was early restricted to persons of rank, and afterwards to the sovereign or his representatives, as the custodians of an arm. In England, the sovereign now bestows knighthood by a verbal declaration, accompanied with a simple ceremony of imposition of the sword, and without any patent or written instrument. In some few instances, knighthood has been conferred by patent, when the persons knighted could not conveniently come into the presence of royalty, as in the case of governors of colonies, or other persons occupying prominent situations abroad. The lord-lieutenant of Ireland also occasionally bestows a career, a delegated power of conferring knighthood. The monosyllable 'Sir' is prefixed to the Christian names of knights and baronets, and their wives have the legal designation of 'Dame,' which in common intercourse becomes 'Lady.'

Persons who are simply knights without belonging to any order, are called in England Knights Bachelor, a name probably corrupted from bas cherues, which is found in Great Britain. A degree of knighthood called Banneret formerly existed in England and France, which was given on the field of battle in reward for the performance of some heroic act. For the mode in which that dignity was conferred, see Banneret. No knight-banneret has been created in the field since the time of Charles I., when that honour was bestowed on one Sir John Smith, for rescuing the royal standard from the hands of the rebels. George III. twice conferred the title on occasion of a review, but the proceeding was considered irregular, and the rank of the knights not generally recognised.

The form of helmet which the requirements of the later heraldry have appropriated to knights, entitling them to place it over their arms, is full-faced, of steel, decorated with bars, and with the visor a little open. It is represented under the article Helmet.

KNIGHT'S FEE. See Knights.

KNIGHTS OF THE SHIRE, otherwise called in England Knights of Parliament. They were knights formerly chosen by the freeholders of every county to represent the county in parliament, and were originally inhabitants of the places for which they were chosen. See Parliament.

KNIGHT'S SERVICE, one of the ancient tenures in England (see Knights), which was
abolished by the time of Charles II, and converted into Freehold (q.v.).

KNIGHTS TEMPLARS. See Templars.

KNIPPERDOLLING, Bernard, a noted leader of the fanatical Anabaptists of the 16th century. See Anabaptists.

KNITTING, an art allied to weaving, but of comparatively modern date. The time and place of its invention are disputed. Some historians insist upon Scotland having the honour, at a date somewhat before the year 1500; others assert that it came from Spain, in the time of Henry VIII.; but there is no proof that the silk stockings which were worn by that monarch were knitted, and in the absence of such proof, the weight of evidence favours Scotland. Knitting consists in using a single thread, and with it forming a continual series of loops across the whole fabric; the next row passes through these, and they in their turn receive another set, until the whole is completed. Knitting is only employed to make small articles, such as stockings, gloves, &c.; and as it furnishes an easy and amusing employment for the hands, without engaging the attention much, it forms a useful and desirable occupation for ladies and others who do not require knitted articles as necessaries, for the knitting-machines have now rendered it impossible for hand-work to compete with them in point of economy or beauty of workmanship. See Hosey.

KNOT, an expression used in speaking of a ship's way through the water, and, as such, representing miles. The log-line is divided by knots into lengths, each of which is to a geographical mile as half a minute is to an hour—i.e., as 1 to 120. The log being cast overboard, note is carefully taken of how many of these knots run out in a half minute, and it follows that the vessel is passing through the water at the same number of geographical miles per hour. The proportion of a geographical to a statute mile being nearly that of 7 to 6 (see MILE), a vessel making 12 knots an hour, is in reality travelling at the rate of 14 statute miles.

KNOT, a twist or loop in a rope or cord, so made that the motion of one piece of the line over the other shall be stopped. The knot owes its power of passive resistance to the friction of the rope. The uses of knots are infinite; in the common occupations of life, one or two simple knots are indispensable; in building, mining, and almost every land occupation, knots of various form are employed; while on shipboard, knots may be almost numbered by the dozen, and each is appropriated to a specific duty. The accompanying diagrams of some of the simpler knots may be generally useful. In these, the position of the rope or cord is shown before tightening, so that the mode of formation may be more readily understood. The simplest knot is the 'overhand' (fig. 1). Its use is to form a knot in a rope to stay it from slipping. By a slight alteration, the 'single sling,' Fig. 3.

or slip knot (fig. 2), is obtained, always in the middle of the rope. More complicated, but still most useful, is the 'double sling' (fig. 3), for suspending a beam or bar horizontally. The bowline knot (fig. 4) serves to give a tight grasp round a pole or beam, which would occupy the loop a, or, drawn close on the rope, it forms a large knot, to prevent the rope passing a hole. The sheepshank (fig. 5) affords a means of shortening a rope temporarily, without diminishing its power of rectilinear tension. All the foregoing have been at the double or middle parts of the rope: for the end of the rope, fig. 6 shows an admirable slip-knot, which maintains its grip until loosened by hand; a is a common overhand knot at the end of the string, to prevent it slipping through the loop b, when tightened.

For modes of joining two ropes, the weaver's or fisherman's knot (fig. 7) may be added as strong and neat. The sailor's knot (fig. 8) has the advantage, when properly made, of resisting all separating strain on the two ropes, and at the same time of being loosened immediately by a pull at one of the short ends. For an interlacing of two doubled ropes, the 'Carrick bend' (fig. 9) has no superior; the point of junction cannot slip, and the moment the tension ceases, the two ropes are again free from each other. Knots have many technical names, such as bight, hitch, &c.

KNOT-GRASS. See Polygonum.

KNOTS of different kinds are borne by different families as heraldic badges, and are occasionally introduced as charges in shields. The arms of

---

Fig. 1. Fig. 2. Fig. 3.

Knots:
1. Wake and Ormonde knot; 2. Lory knot; 3. Hanover knot
some of them appear to be suggested by the initial letter of the name or title of the bearer. In the Wake and Ormonde knot (fig. 1), it is not difficult to trace a W and two Os. The Bourchier knot, as seen on the tomb of Archbishop Bourchier, at Canterbury, bears a resemblance to two Bs, and the Stafford knot to two Ss. The Lacy knot (fig. 2) contains within it a rebus on the four letters of the name Lacy.

KNOT. A scarf composed of many thongs of skin, plaited, and interwoven with wire, which was till lately the favourite instrument of punishment in Russia for all classes and degrees of criminals. The offender was tied to two stakes, stripped, and received on the back the specified number of lashes; 100 or 120 were equivalent to sentence of death, but in many cases the victim died under the operation long before this number was completed. This punishment is at the present time inflicted only upon ordinary criminals, such as incendiaries or assassins. It is no longer in use in the army, except when a soldier is dismissed for ill conduct, in which case three to ten lashes are given, in order to disgrace the soldier, rather than punish him. Thus inflicted, being actual criminal, who prefers this office to exile to Siberia, and who is constantly kept in prison, except when his services are required. The nobility are legally exempt from the knout, but this privilege has not always been respected.

KNOWLEDGE. This term of common use is associated with the greatest problems and controversies of philosophy. The Perception of the External or Material World (see COMMON SENSE, PERCEPTION), the nature of Belief (see BELIEF), the ultimate analysis of a Perception or Judgment (see JUDGMENT), are all involved in the discussion of what is meant by knowledge. Moreover, we may, in connection with this word, take up the consideration of Thought or Intelligence on the whole, in contrast to the feelings and volitions (see INTELLECT). In a still different phase of meaning, we may be led to consider the nature of Science or Philosophy, which is a species of knowledge distinguished by the two features of being generalized, as distinct from individual or particular facts, and being verified or attested by careful evidence, in contrast to the loose assertions that satisfy the ordinary run of mankind.

A distinction, considered by Sir W. Hamilton and others to be of great importance in metaphysical philosophy, is that of Immediate or Presentative, and Mediate or Representative Knowledge. The one is the knowledge or cognizance that we have of the modifications of our own minds, so to speak, without inferring anything beyond, as in our various sensations and emotions. When we are affected by cold or heat, hunger, thirst, colour, or sound, we are conscious of a something, which may be said to be wholly contained in our own minds; but when a present modification of the mind is looked upon not for its own sake, but as embodying something more than itself, as in memory, our knowledge is then said to be mediate. Thus, an actual sensation is immediate, but a recollection, or idea, or imagination is mediate and representative. Mr. Mansel makes this distinction the basis of his division of the mind into two parts: Consciousness, he says, ‘in its relation to the person conscious, is of two kinds; or rather, is composed of two elements—the presentative, or intuitive; and the representative, or reflective. The phenomena of the former class may be distinguished by the terms ‘impressions;’ those of the latter, by that of ‘Thought.’ It will appear from the above remarks that there is no question connected with knowledge that does not fall to be discussed under some other head; and as a general rule, it is best to take up the difficulties connected with the problems of the mind under those names that severally suggest each in its singleness, instead of confusing a multitude together.

KNOWLES, James Sheridan, an English dramatist, was the son of James Knowles, an eminent teacher of elocution, and author of a Dictionnaire de l'anglais Language. He was born at Cork in 1784. The family removed to London in 1792, and here young K. received his education. After holding for some time a commission in the army, he became an actor, and made his first appearance resembling those of Addison, and successor, for he never attained much eminence in this profession. Subsequently, he lived for several years in Belfast and Glasgow, as a teacher of elocution, and it was at this time he laid the foundation of his fame as a dramatist. His first play was performed at Belfast in 1815. It was followed by Virginius, his most effective piece, afterwards recast for the London stage, where Macready took the principal part, he no doing thirteen other plays, but none of his productions exhibit great genius; they are, however, unquestionably the best 'acting plays' produced by an Englishman in modern times. About the year 1840, he relinquished the stage for religious scribings, and in 1842 joined the Baptist body. He latterly distinguished himself by his religious zeal. In 1831, he published a little controversial work, displaying considerable acuteness and ability. The Ideal Improvised by its own Power, in answer to Cardinal Wiseman's Lectures on Transubstantiation. K. died at Torquay, in Devonshire, in December 1862.

KNOXLTONIA, a genus of South African plants, of the natural order Ranunculaceae, with its leaves, flowers, and ordinary fruit. K. resediformis, which has binate leaves, flowers in few-flowered umbels, is remarkable for its acidity and blistering power. The bruised leaves are used at the Cape of Good Hope instead of cantharides; they raise a blister in half an hour, and it keeps open a long time. The sliced root seems to be still more powerful.

KNOX, John, the great Scottish reformer, was born in the year 1563, in a suburb of Haddington called Gifford Gate, where a small field still goes by the name of Knox's Croft. The social position of his parents is not very clearly ascertained. His own statement is, that his great-grandfather, gudeman, and father served under the Earls of Bothwell. He is supposed to have come of an old and respectabie family, the Knoxes of Ranfurly, in Renfrewshire. He received his early education at the grammar-school of Haddington, and in the year 1581 went to the university of Glasgow. He was there a pupil under Major, and soon proved himself an apt and distinguished disputant in the scholastic theology. He was considered as likely to rivet his master in the subtleties of the dialectic art. From the same period he no doubt derived his first impulse to that freedom of political opinion and independence of thought that afterwards characterised him. He is said to have been ordained before the year 1590, about which time, or shortly afterwards, he went to St. Andrews, and began to teach there. There is, however, at this stage of his life a gap of twelve years, or nearly so, which the most careful research has hitherto failed to fill up. His attachment to the Romish Church is supposed to have been shaken chiefly by the death of the Fathers, about 1535; but he did not openly profess himself a Protestant till about 1543.
was degraded from his orders, and being even in danger of assassination, took refuge with Douglas of Longmeynd, and there remained till the end of 1543.

Cardinal Beaton was at this time in the height of his power: after seizing George Wishart at Ormiston, he had him brought to St Andrews, and burned there, in front of his castle, March 1546. K. stationed himself upon the exterior of the Reformation as the companion of Wishart. While the latter prosecuted his career as a preacher in Lethian, K. waited upon him, bearing before him, he tells us, a 'two-handed sword.' He already coveted the post of danger, and full of enthusiasm, was ready to defend his zealous friend at the peril of his own life. After Wishart's seizure and death, he withdrew for a while again into retirement. He would fain have clung to the martyr, and shared his fate, but the latter would not have it so. 'Nay,' he said; 'return to your bairneys, and God bless you: one is sufficient for a sacrifice.' Knox's 'bairneys' were his pupils, the sons of the Lairds of Longmeynd and Oliver. He continued in charge of them for some years, till which period, and which elapsed, the martyrdom of Wishart opened up a more prominent career for him. On the morning of the 29th May 1546, Cardinal Beaton was murdered in his castle, from the window of which he had contemplated the sufferings of the martyr. Taken possession of by the band of nobles and others who had successfully accomplished so audacious a design, the castle at St Andrews became the temporary stronghold of the Reformation in Scotland. K. took refuge in it with his two pupils. Here his great gifts as a preacher were first discovered; and having found the secret of his influence, the parish church of St Andrews soon resounded with his indignant voice and vigorous preaching. At this time, however, was soon cut short by the surrender of the fortress, and his imprisonment in the French galleys.

For two years he remained a prisoner, and underwent, in the course of this time, many privations. He was then liberated, and allowed to depart to England, where he resided for four years, from 1549 to the beginning of 1554, a time of great and fruitful supply to him. He was appointed one of Edward VI's chaplains, and lived on terms of intimate intercourse with Cranmer and others of the English reformers. He is supposed to have had considerable influence on the course of the English Reformation, especially in regard to the liberal changes introduced into the Service and Prayer Book of the Church of England, in the close of Edward's reign. He was much engaged in preaching, especially in the north, in Newcastle and Berwick; and at the latter place he fell in love, and married.

The accession of Mary drove him and others to the continent. He was reluctant to flee, but 'partly by advice and partly by tears,' he was compelled to consult his safety. He settled temporarily at Dieppe, whence we hear of him writing an "Admonition to the Professors of God's Faith in England." He then went into Switzerland, and returning, settled for a time at Frankfurt-on-the-Main, where he is notable in connection with what are known as the 'Frankfurt Troubles,' certain disputes as to the use of King Edward's Service-Book in the congregation of English Protestants there. Towards the end of 1555, he made a rapid visit to Scotland, where he did much to encourage the cause of the Reformation. Convinced, however, that the 'time of deliverance' was not yet come for his country, he retired once more to Geneva, where he settled as pastor of a congregation for nearly three years, which were among the quietest, and probably the happiest years of his life.

Recalled to Scotland in May 1559, he then entered upon his triumphant course as a reformer. Political necessity, especially driven by the Queen-regent to temperate with the 'Lords of the Congregation,' or the reforming nobles. Having somewhat re-established her power, she wished to withdraw her concessions; but the reformers, especially K., could no longer be resisted. The heads of the party assembling at Dundee, under Erskine of Dun, proceeded to Perth. There the pent-up enthusiasm which had long collecting was roused into furious action by a sermon of K., in the bitude of the mass and of image-worship. A riot ensued. The 'rascal multitude,' as K. himself called them, broke all bounds, and destroyed the churches and monasteries. Similar disturbances followed at Stirling, Linlithgow, St Andrews, and elsewhere. The flame of religious revolution was kindled throughout the country, aggravating the civil war already raging. At length the assistance of Elizabeth and the death of the Queen-regent brought matters to a crisis; a truce was made, the great assembly summoned to settle differences. The result of the parliament, which met in August 1560, was the overthrow of the old religion, and the establishment of a new one. K. was not only an active agent, but the agent above all others. The original Confession of Faith of the Reformed Kirk and the First Book of Discipline bear the impress of his mind. He was far from attaching his name to the recent provision for the support of the church and of education throughout the country; he soon found that many of the nobles were far more zealous for destruction than for reformation; still, he accomplished the task assigned to him. His career was only destined to be consolidated after many years.

The arrival of the youthful Queen Mary, in the course of 1561, brought many forebodings to the reformer; he apprehended great dangers to the Reformed cause from her character and her well-known devotion to the Romish Church. The reformer apprehensions scarcely permitted him to be a fair, certainly not a tolerant judge of Mary's conduct. Misunderstandings very soon sprung up between him, and relates, with a somewhat harsh bitterness, several interviews with her. At length he came to an open rupture with the queen's party, including Murray and Maitland, and many others. He was now in a position of unmistakable opposition to the court, and in his sermons and prayers, indulged freely in the expression of his feelings. The result was his temporary alienation from the more moderate Protestant party, who tried to govern the country in the queen's name. For a while, from 1563 to 1565, he retired into comparative privacy.

The rapid series of events which followed Mary's marriage with Darnley—the revolt of the disaffected nobles, with Murray at their head, the murder of Rizzio, and then the murder of Darnley (1567), the queen's marriage with Bothwell, her defeat and imprisonment, served once more to bring Knox into the field, as one who had driven his name and strongly abettıed him in all his schemes of policy during his regency. Further reforms were effected by the parliament which convened under his sway in the close of 1567. The sovereign was taken bound to be a Protestant, and some provision, although still an imperfect one, was made for the support of the Protestant clergy. K. seemed at length to see his great work accomplished, and is said to have entertained the idea of retiring to Geneva. But the bright prospect on which he gazed
for a little was soon overcast—Murray's assassination, and the confusion and discord which sprung out of it, plunged the Reformer into profound grief. He once more became an object of suspicion and hostility to the dominant nobles, and misunderstandings even sprung up between him and some of his brethren in the General Assembly. He retired to St Andrews, for a while, to escape the danger of assassination with which he had been threatened. There, although suffering from the acuteness of his complaints, he roused himself to preach once more, and in the parish church where he had begun his ministry, made his voice to be heard again with something of its old power. Assisted by his servant, the 'good, godly Richard Ballenden,' into the pulpit, he behaved to lean upon it at his first entry; but ere he was done with his sermon, he was so active and vigorous, that he was like to dingle the pulpit in blaze and

In the end of 1572, he returned to Edinburgh to die; his strength was exhausted; he was 'weary of the world,' he said; and on the 24th of November he quietly fell asleep.

K.'s character is distinguished by firmness and decision, and a plain, somewhat harsh sense of reality. He was a man of strong, and even stern convictions, and he felt no scruples, and recognised no dangers in carrying out his convictions. He was shrewd, penetrating, in his perceptions and purposes. No outward show, or conventional pretence, deceived him; he went straight to the heart of everything; and consistently with this clear and rough shrewdness of perception, his language is always plain, homely, and many will say harsh. He had learned, he himself says, 'to call wickedness by its own terms—a fig, a fig; a spade, a spade.' Above all, he was fearless; nothing daunted him; his spirit rose high in the midst of danger. The Earl of Morton said of him truly, as they laid him in the old churchyard of St Giles: 'He never feared the face of man.' In Scotland, K., no doubt, accomplished a great work. Whether the work would not have been better if it had been less violently done, if the spirit of love and moderation, as well as the spirit of power, had presided over it, is a question regarding which there may be much division. But even if we should take exception to some things he did or encouraged, we may admire the consistent boldness, the deep earnestness, and the self-denying, unfailing zeal of the great Reformer.

KNOXVILLE, a city of Tennessee, United States of America, on the north bank of the Holston River, at the head of steam-boat navigation, 185 miles east of Nashville. It is the principal and central town of East Tennessee, on the East Tennessee, Georgia, and Virginia Railway. It is the site of the University of East Tennessee, the state Deaf and Dumb Asylum, and has 3 academies, 8 churches, 4 newspapers, and several flouring-mills and glass factories. Pop. about 3500.

KNUTSFORD, a small market-town of Cheshire, 23 miles east-north-east of the city of Chester. Pop. 5773. The name is said to be derived from King Canute, or quotient, having with his army forded the Bollin here.

KO'ALA (Phascolarctos cinereus), a marsupial quadruped, commonly referred to the family Phalangidae, and pretty nearly resembling the phalangers in dentition. The K. is about the size of a cat, and much larger. The toes of the fore-feet are in two opposable groups, to of and three, a character not found in any other quadruped, but well adapted to grasping the branches of trees, on which the K. often hangs with its back undermost, like the sloth. There is

scarcely any rudiment of a tail. The general form is not unlike that of a young bear. The female carries her young on her back, for a long time after it is capable of leaving her pouch.

KO'BBE, a town of Central Africa. See DARFUR.

KOBOLEDS. See GORILLES AND BORMES.

KOCH, KARL HEINRICH EMANUEL, a celebrated traveller and naturalist, was born at Weimar in 1809. He studied at the universities of Würzburg and Jena, and in 1836, undertook a scientific journey to Southern Russia, completing his researches in a second journey, which he performed in 1843, this time visiting also Turkey, Armenia, Pontus, the Caspian Sea, and the range of the Caucasus. In 1839, he was appointed Professor of Botany in the University of Jena. The most important of his works are—Monographia generis Veronicis (Würzburg, 1833); Reise durch Russland nach dem Kaukasischen Isthmus (Journey through Russia as far as the isthmus of the Caucasus, Stuttgart, 1842–1843). His second journey supplied the materials for Wanderungen im Oriente (Wanderings in the East, Weimar, 1846–1847); and in 1854 appeared his work on the Crimea and Odessa. Besides these, he has written about nine other works on geography, botany, and topography.

KOCK, CHARLES PAUL DE, a French novelist, dramatist, and poet, born at Plassey, near Paris, in 1794, is the son of a Dutch banker, who perished on the scaffold during the French Revolution. Originally intended for a mercantile career, he devoted himself to literature against the wishes of his relatives. His novels, though displaying no trace of real genius, have acquired an enviable notoriety by the licentious freedom of their representation. K. has composed upwards of 50 novels, besides a great number of vaudevilles and stories in verse. His earlier works, in a literary point of view, are considered superior to his later ones. Among others, we may mention Georgette, ou la Vérité du Tabellion; Guillaume, ou le malheureux Sujet; Le Barbier de Paris; La Femme, le Mari et l'Amant; Monna Parisiennes.—HÉRÉ DE KOCK, son of the preceding, like Dumas fils, has unhappily followed his father's footsteps, if we may judge from the titles of some of his novels: Le Roi des Étudiants et la Reine des Oriettes, Les Amants de ma Maltrice, Lorette et Gentilhommes, &c.

KO'DIAC, an island to the south-east of the peninsula of Alaska (q. v.), contains the oldest settlement in Russian America, as distinguished at least from the Aleutian Archipelago. It is little better than an irregularly shaped mass of mountains, measuring 75 miles by 50. The chief value of K. consists in the tolerable harbour of St Paul, on its north coast.
KOHAT, a town of the Punjab, stands in lat. 32° 22' N., and long. 71° 27' E., in a small but fertile and populous mountain-valley of the same name, which forms an administrative district. A few miles to the east of it are springs of naphtha, and rich deposits of sulphur. Kohat is traversed by two important routes—the route from Peshawur to Kala Bagh, and another by Bungush to Kohassan.

KOH-I-NUR (Mountain of Light), the name of a large diamond now in the possession of Her Majesty Queen Victoria. According to Hindu legend, it was found in a Golconda mine, and its possessors have, with few exceptions, been the rulers of Hindustan. After belonging successively to the Bahmani, Khilji, Lodhi, and Meuul kings, it came, in 1739, into the hands of Nadir Shah, who gave it its present designation. From him it went to the Aboul monarchs of Afghanistan, the last of whom, Shah Sujah, gave it to Runjeet Singh, the ruler of the Punjab. On the abdication of the Marajjar Shah Dughlat in 1856, the annexation of the Punjab in 1843, it was surrendered to the sovereignty of Great Britain. It is said to have weighed originally 900 carats, but, after being cut, was reduced to 279 carats. It was reduced by re-cutting, and in this state was shown at the Great Exhibition of 1851; since which time it has been again recut (1852), and now weighs about 123 carats, and has been valued at £120,000. The Koh-i-nur is rose-cut.

KOHL, Johann Georg, an eminent German traveller and author, was born at Bremen, April 29, 1800; studied at Göttingen, Heidelberg, and Munich; and settled in Dresden, in 1828, from which place as a starting-point, he made excursions in all directions, visiting every important district of Europe, and on his return from each expedition, published his experience in a series of works. In 1854, he went to America, where he travelled for four years, and returned to Germany. His works on Europe are so numerous and well known that a full detail of them is unnecessary; suffice it to say, that he has described the countries of Austria (1842), Bavaria (1842), England (1842 and 1844), Russia (1846—1847), Denmark (1846 and 1847), Istria, Dalmatia, and Montenegro (1851), &c. The results of his American experience were published in Travels in Canada (1855), Travels in the United States (1857), and Kitachi-Giiti, or Tales from Lake Superior (1860). Another work of K. is the History and Commentary on two Maps of the New World made in Spain at the Commencement of the Reign of Charles V. (1861), which cost him two years' intense labour. K. is at present engaged in the preparation of a Geographical History of America.

KOHL-RABI, or, more properly, KOHL-RÜBE (Germ. Kale-turnip, similarly called Chou Rouge by the French), a cultivated variety of the Kale or Cabbage (Brassica oleracea), distinguished by the swelling of the stem just above the ground, in a globular form, to the size of a man's fist, or larger, leaf-stalks springing from the same part, and adding to the peculiarity of its appearance. This is the part which is used, and its uses are similar to those of the turnip. In quality, it more nearly resembles the Swedish than the common turnip, and is used for feeding cows does not give them milk a disagreeable flavour, as when they are fed on turnips. K. is very hardy, its leaves, as well as its stem and root, enduring the most severe winters, although in Britain its cultivation has hitherto been chiefly in the south of England. It is a common field-crop in Sweden. In the cultivation of K., it is usual to sow it on seed-beds, and to transplant by dibbling into fields; but this is perhaps not the best mode. It ought, however, to be sown earlier than the even Swedes' turnip; and raised drills are unanswerable for it, owing to the effect of winds. It is more mild and more nutritious than any kind of turnip of the same size. There are numerous sub-varieties, K., like all the varieties of Brassica oleracea, delights in a sandy, loamy soil and abundant manure.

KOKRA WOOD, or COCUS WOOD, the wood of an Indian tree, Lepidostachys Rozehrigii, which belongs to a very small natural order, Spermacet, remarkably allied at once to Ephedra and to Amentacea. K. is imported into Britain in logs of six or eight inches in diameter, having the heart-wood of a rich deep brown colour and very hard. It is much used in the manufacture of flutes and other musical instruments. The Kokra wood has leatherly, alternate leaves.

KOLA, a place of scarcely 800 inhabitants, but of worth in consequence as the most northern town of European Russia, and except Wardoe, in Norway, the most northern in Europe. It is situated between the Kola and its tributary, the Toluma, not far from the icy Sea, and has a secure and capacious harbour which, inhabited by Russians, Lapds, and Finns, and are chiefly occupied with walrus, whale, and cod fishery.

KOLAI'N, a town in the government of Tver, European Russia, situated on the right of the Volga, carries on an extensive trade in corn, tallow, and linen. Pop. 19,588.

KOLAR, John, one of the most conspicuous Slavic poets and scholars, was born, in 1783, at Moschowze, in the north-west of Hungary, studied at Pressburg and Jena, and in 1819 became pastor of a Protestant congregation at Pesth. His first work was a collection of Slavonic songs and Hymns, which was translated into German and Latin and published at Prague (Poema, Prague, 1821); this was followed by his Slavische Decora (The Daughter of Glory, Buda, 1824; 3d ed., Pesth, 1832), regarded by his countrymen as his greatest work; and Rosprawy i Liscowach (Treatises on the Name and Antiquities of the Slavic People and their Inscriptions, Buda, 1830). K.'s fame, however, rests more on his being one of the earliest and most zealous advocates of Pan-Slavism (q. v.). The work in which this tendency first appears was written in German, and is entitled Uber die literarische Wechselwirkung zwischen den Stammen und Mundarten der Slav. Nation (Pesth, 1831). The revolution in Hungary compelled him to abandon his country. He withdrew to Vienna, where he was made Professor of Archaeology in 1848. He died January 29, 1852.

KÖLLIKER, Alfred, a German physiologist, was born in 1817, and is at present Professor of Anatomy and Physiology in the university of Würzburg. He is praised for his labours in the department of microscopic anatomy, and on the development of the embryo; but his contributions to natural history generally are by no means unimportant. Among his principal works must be named his Mikroskopische Anatomie; , H., Abhandlung der
KOLLIN—KÖNIGSBERG.

Geweluchte des Menschen (which has been translated for the Sydenham Society by Busk and Huxley, under the title of *A Manual of Human Histology*, in two volumes); *Die Siphonophora oder Seewirmenpolypen von Mosassa*; and *Entwicklungsgeschichte des Menschen d. höheren Thiere*. In association with von Siebold, he is also the editor of *Zeitschrift für wissenschaftliche Zoologie*, the most important scientific natural-history journal of Germany.

KOLN, or NEU-KOLN, a town of Bohemia, on the Elbe, about 45 miles east of Prague, with a population of 6200, is noted for the great battle fought, June 18, 1757, in its vicinity, between 60,000 Austrians under Marshal Daun, and 32,000 Prussians under Frederick II. The latter were defeated in spite of the obstinate valour of their monarch, who charged at the head of his cavalry seven times in succession.

KOLOM'EA, a town of Austrian Galicia, is situated on the Pruth, at the base of the Carpathian Mountains, 112 miles south-south-east of Lemberg. It is a very old town, and formerly carried on an extensive trade in tobacco. Pottery is still manufactured. Pop. 13,400, half of whom are Jews.

KOLOMNA, a district town of Great Russia, in the government of Moscow, is situated 62 miles south-east of the city of that name, on the river Moskva. It contains 13,703 inhabitants. The communications by water between it and Nijni-Novgorod and Moscow, and the railway already completed from Moscow to this town, and to be carried on to Rician, have already increased the trade of the district. Weaving, silk-spinning, and cotton-printing are carried on, with manufactures of cotton and leather.

KOLYA'M, a river in Eastern Siberia, flowing from the Stanovoy Mountains, among which it takes its rise in lat. 61° 3' N. After a north-east course of 1000 miles, it falls into the Arctic Ocean in lat. 69° 40' N.

KOLYVA'N, a town in the government of Tomsk, in Siberia, situated on the river Ob, lat. 55° 21' N., and long. 82° 46' E., is remarkable for the extensive quarries of jasper in its neighbourhood. There is also a large depositary of jasper and jasper ornaments, which belongs to the Russian government. Pop. 2172.

KOLZOW, ALEXEI VASILIEVICH, a Russian poet, prematurely cut off in the early blossom of his genius, most of whose songs are among the choicest productions of Russian literature. He was just about to settle in St Petersburg, and to devote himself exclusively to literary pursuits, when he suddenly died, in 1842. A complete edition of his poems, with a biography of the author, was published by Belinsky in 1846.

KÖNG, a name applied to a mountain-range, a district, and a town, all of which are situated north-west from the coast district, in the west of Northern Africa. —The mountains extend from west to east at the distance of about 200 miles from the shore of the Gulf of Guinea, and are said to be an offset from the high table-land of Senegambia. Little is known regarding them. The highest known summits reach an elevation of only 2500 feet.—Regarding the K. district, all we know is, that it is remarkable for the industry of its inhabitants, and for the gold-trade which is there carried on. —The town of K., in lat. 8° 55' N., and long. 3° 30' W., is situated among hills 540 miles south of Timbuctu. It is a large town, consisting entirely of clay-houses, and is the centre of numerous converging caravan routes. The inhabitants, who are chiefly Mandinga, and of the Mohammedan religion, manufacture cotton-cloths extensively.

KÖNIEH, a large town of Asiatic Turkey, capital of the province of Karaman, situated in a rich, well-watered plain, in lat. 37° 54' N., and long. 32° 40' E. It is surrounded by walls from two to three miles in circuit, built from the ruins of ancient Seljuk edifices, and surmounted by square towers. Its public buildings, its mosques and other public buildings, give it an imposing appearance, but like most of the towns of Asia Minor, it is now in a sadly ruinous condition. Many interesting remains of Saracen architecture, however, are still to be met with. K. is the chief emporium for the products of the interior. Carpets and coloured morocco leather are manufactured, and cotton, wool, and skins are exported to Smyrna. Pop., including the suburbs, 50,000.

K., the ancient Itonium, was famous in ancient times as the capital of Lycaonia. From 1087 to 1299, it was the seat of a Seljuk sultanate. On December 20, 1832, a battle was fought here, in which Ibrahim Pasha completely defeated the Turkish army.

KÖNIG, FRIEDRICH, the inventor of the steam-press, was the son of a respectable citizen of Eisleben, and was born there, 17th April 1775. He became a printer, and was also for a short time a bookseller, but was unsuccessful in this business. He eagerly pursued both literary and scientific studies. Having devoted himself to the invention of means of printing by machinery, he applied in vain for the necessary pecuniary assistance in various quarters, his schemes being rejected as impracticable; but at last Thomas Bentley, a printer in London, came forward to his support, a company was formed, and a patent was obtained on 29th March 1810, for a press which printed like the hand-press by two flat plates, and in 1811 it was first used to print part of the *Annual Register*. A second patent was obtained on 30th October 1811 for a cylinder-press, a third in 1813 for improvements upon it. This improved machine was soon adopted by the proprietors of the *Times*, and on 29th November 1814, that newspaper appeared for the first time printed by machinery which was moved by a steam-engine. In the latter part of his life, K. was a partner in a company for making steam printing-presses at Oberzell, near Wurzburg, in Bavaria. He died 17th January 1833.

KÖNIGGRATZ, a town and fortress of Bohemia, on the left bank of the Elbe, at the confluence of the Adler with that river, 64 miles east-north-east of Prague. It is the seat of a bishop, and has a beautiful cathedral. The immediate neighbourhood can in any emergency be covered with water. Cloth, musical instruments, shoes, and wax-candles are the staple articles of manufacture. Pop. 8300.

KÖNIGNHOF, a small manufacturing town of Bohemia, on the left bank of the Elbe, 16 miles north of Königgrätz. Linen-weaving, tanning, and manufactures of hats and sugar, are the principal branches of industry. Pop. 5000.

KÖNIGSBERG, a small town of Prussia, in the province of Brandenburg, on the Rörike, 45 miles north of Frankfurt-on-the-Oder. Tanning and distilling are the chief branches of industry. Pop.
KÖNIGSBERG.—KONRAD VON WÜRZBURG.

5600. Numerous other places in Germany bear this name.

KÖNIGSBERG, an important town and fortress of Prussia, is situated in the province of East Prussia, is the town on both banks of the Pregel, and on an island in that river. It dates from the 12th century, when it entered into the Frisian group of towns. It consists of the Old Town and the Lübeck in on the north bank (the latter of which, in its seven-storied and gabled houses, and steep side-lanes, still presents a completely Hanseatic appearance), the new town on the island (also one of the oldest parts), and numerous suburbs. The Pregel is here crossed by seven bridges. The origin of the town dates from the erection of a castle by Otto, king of Bohemia, in 1237. K. became a member of the Hanseatic League in 1386, received the residence of the grand-master of the Teutonic Order from 1457 to 1528. In 1701, Frederick, Elector of Brandenburg, was crowned here, with the title of Frederick I., King of Prussia. Its chief buildings are the cathedral, containing the tomb of Kaut; the university, founded in 1544, and attended now by about 300 students; the united Royal and University Library, with 160,000 volumes; and the observatory. There are also three gymnasiums, with numerous other educational and benevolent institutions. Important manufactures of woollens, silk, leather, and tobacco are carried on. Wine, fruits, coal, salt, and sugar are imported; grain is the chief article of export.

KONRAD or CONRAD I., king of the Germans (a title identical with the subsequent one of "Emperor of Germany"), was the son of Conrad of Pritzlar, Count of Franconia, and the nephew of the Frankish duchy of Saxony. On the extinction of the direct line of the Carolingians, the Germans resolved to make the sovereign dignity elective, and preferring to choose one who was related to the late imperial family, offered the crown to Otho the Illustrious, Duke of Saxony, who refused it, but recommended K., who was accordingly elected in 911. The new monarch gradually re-established the imperial authority over most of the German princes, carried on an unsuccessful war with France, and at last fell mortally wounded at Querlinburg (918), in a battle with the Hungarians, who had repeatedly invaded his dominions. He lies buried at Fulda. On his deathbed, he enjoined his brother Eberhard to the Knobhuf on the island (also one of the oldest parts) of the shore of the Pregel, and to Otho the Illustrious, with whom he had been continually at war since 912 A.D., and accompanied the gift with the chivalrous message, "that he wished to render to the son he had received from the father." K.'s reign was a remarkable epoch in the history of Germany; sovereignty by hereditary right was introduced into the German duchies and markgrafdoms; the minor lords of the soil became vassals, not to the king, as formerly, but to their dukes; and finally, the crown-lands in each duchy were taken possession of by the dukes themselves, who thus totally destroyed the sovereign's local jurisdiction.

KONRAD II., king of the Germans, and Roman emperor, was elected after the extinction of the Saxon imperial family in 1054. He was the son of Henry Duke of Franconia, and is by many considered as the founder of the Franconian dynasty. Immediately after his election, he commenced a tour through Germany to announce his election publicly to the principal princes and courts and to give himself with, and, if necessary, to anoint, the condition of his subjects. With a view to this last, he instituted the God's Truce (q.v.). In 1026, he crossed the Alps, chastised the rebellious Italians, was crowned at Milan as king of Italy, and he and his wife Gisela were anointed emperor and empress of the Romans by the pope. He was soon recalled to Germany to put down four formidable revolts which he succeeded so well, that by 1033 peace was restored. In 1032, he succeeded the Markgraf of Burgundy, which he annexed to the empire. In 1036, a rebellion in Italy again compelled him to cross the Alps; but his efforts to restore his authority were this time unsuccessful, and he was forced to grant several privileges to his Italian subjects. Shortly after his return, he died at Utrec, 5th June 1039. K. was one of the most remarkable of the earlier monarchs of Germany. He repressed the more numerous features of the feudal system, and by conferring the great dukies of Bavaria, Swabia, and Carinthia on his son, reduced the danger of the great dukes of the empire.

KONRAD III., king of the Germans, the founder of the Hohenzollern (q.v.) dynasty, was the son of Frederick of Swabia, and was born in 1093. While under the age, he, with his elder brother, Frederick, had bravely supported Henry V. against his numerous enemies, and in return, that monarch granted K. the investiture of the duchy of Franconia. He subsequently contested the crown of Italy with the Emperor Lothaire II., but was compelled to resign his pretensions. On the death of Lothaire, the princes of Germany, fearing the increasing preponderance of the Guelf party, and attracted by his brilliant courage, moderation, and goodness, offered K. the crown, and he was accordantly formally elected at Aix-la-Chapelle, 21st February 1138. He was immediately involved in a quarrel with Henry the Proud, Duke of Bavaria and Saxony, and with the Guelf part in the Holy Roman Empire, and the struggle was continued under Henry's son and successor, Henry the Lion (q.v.). While Germany was thus convulsed, the state of Italy was not a whit more peaceful. The several belligerents bestowed K.'s assistance, but he well knew the natural inconstancy of the Italians, and determined to stand aloof. Soon after this, St Bernard of Clairvaux commenced to preach a new crusade, and K., seized with the general infatuation, set out for Palestine and took with him a part of the Holy Land, in company with his old enemy, Guelf of Bavaria. Guelf returned to Germany before K., and with his nephew, Henry the Lion, immediately renewed the attempt to dispossess K. of his dominions in Italy, while his army being defeated at Flechberg, they were compelled to sue for peace. K. was now called upon to aid the Duke of Poland against his rebellious subjects, and the pope and the northern Italians against Roger of Sicily; but while preparing for his latter expedition, he was poisoned, 15th February 1192, at Bamberg. K. was largely endowed with the virtues necessary for a great monarch, and though himself unlearned, was a warm patron of science and letters. His marriage with a Greek princess was symbolised by the two-headed eagle which figured on the arms of the Emperor of Germany, and now appears on the arms of the sovereign of Austria, as heir to the German emperors.

KONRAD VON WÜRZBURG, one of the most celebrated poets of the middle ages, died at Basel in 1287. K. is fertile in imagination, learned, and—although marking the decline of medieval High-German poetry by his prolix and artificial style—probably the most perfect master of German versification, caleolar, inventing many new words and augmenting others. His last poem, which he left in an unfinished condition, has for its subject The Trojan War, and is printed (in part) in Muller's Sammlung altdeutscher Gedichte. But K. appears to meet advantage in his earlier narrative poems, of which the best is Einhard
KONRADIN OF SWABIA—KORAN.

(reprinted by Haupt at Leipzig in 1844, from an old and scarce impression). Next to this may be ranked his Otto mit dem Bart (reprinted by Hahn at Quedlinb. and Leip. 1838); Der Welt Lohn (by Roth, Fkr. 1843); The Legends of Syria (by W. Grimm, Gött. 1841) and of Lesbos (by Massmann, Quedlin, and Leip. 1843); Die Goldene Schmiede (by W. Grimm, Berl. 1840). His songs and proverbs are to be found in Hagen's Minnesinger.

KONRADIN OF SWABIA, the last descendant of the imperial House of Hohenstaufen (q.v.), was the son of Konrad IV., and was born in 1222, two years before his father's death. Innocent IV., immediately seized upon the young prince's Italian possessions, on the plea that the son of a prince who dies excommunicated has no hereditary rights; and the other enemies of the House of Hohenstaufen rejoiced to follow the pope's example. K. was not left, however, totally friendless. His uncle Manfred took up arms in his behalf, drove the pope from Naples and Sicily, and in order to consolidate his nephew's authority, declared himself king till the young prince came of age. The pope's invertebrate hatred of the Hohenstaufens induced him to offer the crown of the Two Sicilies to Charles of Anjou, a consummate warrior and able politician. Charles immediately seized on it and met his antagonist in the plain of Grandella, where the defeat and death of Manfred, in 1266, gave him undisturbed possession of the kingdom. But the Neapolitans, detesting their new master, sent deputies to the Hohenstaufen in large numbers, gained several victories over the French, but was finally defeated, and along with his relative, Frederick of Austria, taken prisoner near Tagliacozzo, 22d August 1268. The two unfortunate princes were, with the consent of the pope, executed in the market-place of Naples on the 26th October. A few minutes before his execution, K., on the scaffold, took off his glove, and threw it into the midst of the crowd, as a gage of venge ance, requesting that it might be carried to his heir, Peter of Aragon. This duty was undertaken by the Chevalier de Waldburg, who, after many hair-breadth escapes, succeeded in fulfilling his prince's last command. See Sicilian Vespers.

Koodoo (Antilope strepsiceros).

KO'O'DOO (Antilope strepsiceros, or Strepsiceros koodoo), one of the largest species of antelope. The general form is not so light and elegant as that of many of the antelopes. The height is about four feet, and the length fully eight feet, exclusive of the tail, which is moderately long, and terminates in a tuft like that of an ox. The male is furnished with great horns, nearly four feet long, and beautifully twisted in a wide spiral of two turns and a half; very thick at the base, and there wrinkled and ringed. The female is smaller than the male, and hornless. The general colour is grayish brown, with a narrow white stripe along the middle of the back, and eight to ten similar stripes proceeding from it down the sides. The K. lives in small families of four or five, inhabiting chiefly the wooded parts of South Africa. It is easily domesticated, and is one of the animals which, probably, man has not yet done enough to reduce to his service.

KO'OMRAH (Equus hippocrepus), an alleged distinct species of the family Equidae, a native of North Africa, and inhabiting mountain woods. It is ten or ten and a half hands high; with a broad deep head; no forelock, but long woolly hair down to the eyes; long black mane; tail more like that of a horse than of an ass; the colour uniform reddish bay, without mark or streak. Colonel Hamilton Smith supposes that it may be the Borjes of Herodotus, and Hippocrates of Opperian.

KOORIA MOORIA ISLANDS, a group of six islands, on the south coast of Arabia, are situated about 21 miles from the coast, about lat. 17° 55' N., and long. 56° 6' E. of the surface of the sea, and surrounded by a shallow breakwater, and the only one which is inhabited supports only from 20 to 30 fishermen. They were ceded to England in 1834. Guano of an inferior quality is obtained from them.

KO'PEK, a Russian money of account, the 1/43rd part of a Ruble (q.v.), and equivalent to 1/4 farthings of sterling money.

KO'RAN [Arab., from karaa, to read]. [= Hebr. Mikra, the written Book, or that which can and ought to be read;—the Old Testament, in contradistinction to Mishnah, or the Code of the Oral Law, The Reading, by way of eminence; a term first applied to every single portion of Mohammed's 'Revelations,' at a later period, used for a greater number of these; and finally for their whole body, gathered together into one book, which forms the religious, social, civil, commercial, military, and legal code of Islam. The Koran is also known under the name of Prikon (Chald. Salvation, not from Hebr. Perek, Division, as erroneously supposed); further, of Al-Moshaf (The Volume), or Al-Kitab ('The Book, in the sense of 'Bible'), or Al-Dhikr ('the Reminder,' or 'the Admonition'). The Koran is, according to the Moslem creed, coeval with God, uncreated, eternal. Its first transcript was written from the beginning in rays of light upon a gigantic tablet resting by the throne of the Almighty; and upon this tablet are also found the divine decrees relating to things past and future. A copy of it, in a book bound in white silk, jewels, and gold, was brought down to the lowest heaven by the angel Gabriel, in the blissful and mysterious night of Al-Khadir, in the month of Ramadan. Portions of it were, during a space of twenty-three years, communicated to Mohammed, both at Mecca and Medina, either by Gabriel in human shape, 'with the sound of bells,' or through inspirations from the Holy Ghost in the Prophet's breast, or by God himself, veiled and unveiled, in waking or in the dreams of night. Traditions vary with respect to the length of the individual portions revealed at a time, and between single letters, verses, and entire chapters or Surahs (from Hebr. shurah, 617}
KORÁN.

(line). The first revelation forms, in the present arrangement of the book, verses 1–5 of surah xv., and begins with the words: 'Read (preach), in the name of thy Lord, who has created all things!'

Mohammed dictated his inspirations to a scribe, not, indeed, in broken verses, but in finished chapters, and from this copy the followers of the Prophet procured other copies—unless they preferred learning the oracles by heart from the master's own mouth. The original fragments were, without any attempt at a chronological or other arrangement, promiscuously thrown into a box, and a certain number were entirely lost. A year after the death of Mohammed, the scattered portions were, at the instance of Abu Bekr, collected by Zaid Ibn Thabit of Medina, 'from date-leaves and tablets of parchment, and the breasts of men,' and faithfully copied, without the slightest attempt at moulding them into shape or sequence, together with all the variants, the repetitions, and the gaps. This volume was intrusted to the keeping of Hafsa, one of the Prophet's wives, the daughter of Omar. A second redaction was instituted in the thirtieth year of the Hijrah, by Caliph Othman, not for the sake of arranging and correcting the text, but in order to restore its unity; many readings being current among the believers. He ordered new copies to be made from the original fragments, in which all the variants were to be expunged, without, however, any further alteration, such as the suppression of certain passages, &c., or introduced, and the MSS. afterwards all consigned to the flames. With respect to the succession of the single chapters—114 in number—no attempt was made at establishing continuity, but the chapters being ranged according to their respective lengths; so that, immediately after the introductory fatrah or exordium, follows the longest chapter, and the others are ranged after it in decreasing size. They are not numbered in the MSS. In the modern version, and bear distinctive, often strange, sounding headings, as: the Cow, Congealed Blood, the Fig, the Star, the Towers, Saba, the Poets, &c., taken from a particular matter or person treated of in the respective chapters. Every chapter or surah is introduced with an introductory form: Ara: 'In the name of God, the Merciful, the Compassionate.'

It is further stated at the beginning whether the surah was revealed at Mecca or at Medina. Every chapter is subdivided into smaller portions (Ajahid, Hebr. Ola), which are lettered, bisected, in seven editions or primitive copies of Medina (two), Mecca, Kufa, Basra, Syria, and the 'Vulgar Edition'—reduced by Nöldeke to four editions—between 6000 and 6000. The number of words in the whole book is 77,530, and an enumeration of the letters shews an amount of 323,016 of these. Other—encyclopaedic—divisions of the book are: into thirty ajah and into sixty ajahb, for the use of devotional readings in and out of the mosque. Twenty-nine surahs commence with certain letters of the alphabet, supposed to be of mystical purport.

The contents of the Koran as the basis of Mohammedanism will be considered under that head, while for a closer connection with the ancients, and to make the clear connexion of its historical character with the former, of which a striking example is given by the author of Genesis, we must refer to the QUR'AN. Briefly, it may be stated here, that the chief doctrine laid down in it is the unity of God, and the existence of but one true religion, with changeable ceremonies. When mankind turned from it at different times, God sent prophets to lead them back to truth: Moses, Christ, and Mohammed being the most distinguished. Both punishments for the sins committed by the profane are depicted with great vividness, and exemplified chiefly by stories taken from the Bible, the Apocryphal writings, and the Midrash. Special laws and directions, admonitions to moral and divine virtues, more particularly to a complete and unconditional resignation to God's will (see ISLAM), legends, principally relating to the patriarchs, and, almost without exception, borrowed from the Jewish writings (known to Mohammed by oral communication only, a circumstance which accounts for their often odd connection), form the bulk of the book, which throughout bears the most palpable traces of Jewish influence. Thus, of ideas and notions taken bodily, with their Arabicised designations, from Judaism, we may mention—Korán = Mikrah (Reading); Forkán (Salvation); the introductory formula, Bismillah (in the name of God); Torah (Book of Law); Gn Edén (Paradise); Gehinnom (Hell); Haber (Master); Darasch (to search the sacred above); the Rasa, and the Rasa (Teacher); Sabbath (Day of Rest); Shechinah (Majesty of God); Mishnah (Repentance, or Oral Law), &c. The general tendency and aim of the Koran is found pretty clearly indicated in the beginning of the second chapter: 'This is the book in which there is no doubt; a guidance for the pious, who believe in the mysteries of faith, who perform their prayers, give alms from what we have bestowed upon them, who believe in the revelation which we made unto our servants in the past, before you, and who believe in the future life, &c.' To unite the three principal religious forms which he found in his time and country—viz., Judaism, Christianity, and Heathenism—into one, was but a mere idiosyncrasy of him, if we only read, discloses constantly the alternate strata and threats aimed at each of the three parties. No less are certain abrogations on the part of the Prophet himself, of special passages in the Koran, due to the vacillating relation in which he at first stood to the different creeds, and the concessions first made, and then revoked. Witness the 'Kiblah,' or the place where the believer was to turn in his prayer, first being Jerusalem; fasting, being at first instituted in the ancient manner; forbearance to idolaters forming one of the original precepts, &c.

The language of the Koran is of surpassing elegance and purity, so much so, that it has become a standard of correct Arabic; and a human pen is supposed to be capable of producing anything similar—a circumstance adduced by Mohammed himself as a clear proof of his mission. The style varies considerably; sometimes it is concisely and majestically; at other times, fluent, and harmonious; it at other times becomes verbose, sententious, obscure, tame, and prosy; and on this difference modern investigators have endeavoured to form a chronological arrangement of the Koran, wherever other dates fail. But none of these attempts can ever be successful. Full manhood, approaching age, and declining vigour, are not things so easily traced in the writings of a man like Mohammed. The Koran is written in prose, yet the two or more links of which generally a sentence is composed, rhyme with each other, a peculiarity of speech used by the ancient soothsayers (Kuhbán = Cohen) of Arabia;—only that this Mohammedan religion has adapted itself to this form, and freeing it from conventional fetters; and thus the rhyme of the Koran became an entirely distinctive rhyme. Refrains are introduced in some surahs, and play upon words not standardized.

The outward reverence in which the Koran is held throughout Mohammedanism, is exceedingly great. It is never held below the girdle, never touched without previous purification; and an injunc tion to treat it with respect is repeated with great diffuseness, and exemplified chiefly by stories taken from the Bible, the Apocryphal writings, and
KORDOFAN—KOSCIUSKO.

sentences from it are inscribed on banners, doors, &c. Great lavishlyness is also displayed upon the material and the binding of the sacred volume. The copies for the wealthy are sometimes written in gold, and the covers blaze with gold and precious stones. Nothing also is more hateful in the eyes of a Moslem than to see the book in the hands of an unbeliever.

The Koran has been commented upon so often that the names of the commentators alone would fill another volume. Thus, the library of the Megerlin, in Syria, is reported to have once contained no less than 20,000 different commentators. The most renowned are those of Samachabari (died 539 H.), Beidhavi (died 685 or 716 H.), Mahalli (died 870 H.), and Syouti (died 911 H.). The principal editions are those of Hinkelmee (Hamburg, 1694); Maracci (Padua, 1698), Fligel (3d ed. 1838), besides many editions (of small critical value) printed in St. Petersburg, Kasan, Teheran, Calcutta, Cawnpore, Scampore, and the many newly-erected Indian presses. The first, but very imperfect, Latin version of the Koran was made by Robertus Retensi, an Englishman, in 1143 (ed. Basle, 1543). The first French translations are in the name of Maracci, into Latin (1598); Sale (first ed. 1734) and Redwell (1862), into English; Savary (1783), Garcin de Tassy (1829), Kasimirski (1840), into French; Megeletis (1772), Wahl (1828), Ullmann (1840), into German; besides the great number of Persian, Turkish, Malay, Hindustance, and other translations made for the benefit of the various eastern Moslems. Of concordances to the Koran may be mentioned that of Fligel (Leips. 1842), and the New-jewish-Poecilikan (Calcutta, 1811). Of authori-

KORDOFAN, or the White Land, a province of the Egyptian territories in the Sudan, is bounded on the E. by the White Nile, which separates it from Sennar, and is separated on the W. from Darfur by a strip of desert. It extends in lat.

from 10° to 15° 20' N., and the area of its more or less cultivated portion has been estimated at 12,000 square miles, and its population at 500,000.

The province is traversed by no rivers; wells, however, abound, water being found almost everywhere, at a comparatively small depth. In the south, the surface is undulating, the soil argillaceous and productive; and here corn and maize are grown. In the north and west, the surface is an elevated plateau, and the soil sandy, but peculiarly fit for the cultivation of millet, which is the staple article of food. The employ-

ments of the people are chiefly agricultural. In the south, horned cattle and horses are extensively reared, but in the north and west, the nomad inhabitants depend for support entirely upon their large herds of camels, which are hired out for the transport of produce and merchandise. The chief trees are acacias, yielding gum-arabic. Iron ore is obtained and wrought in the country. Slavery, which had formerly flourished in the Sudan, was abolished in 1857 by Said Pasha, the Egyptian viceroy. The people are Mohammedans.

The inhabitants are partly Arabs, partly a mixed Arab and negro race. The capital is II-Oleid or Lobeid (q. v.). In 1770, Adlan, king of Sennar, made a conquest of K., and about six years after, the Sultan of Darfur overran the province, and annexed it to his territories. Under the sultan, the inhabitants were but lightly taxed; trade was opened up with the Sudan and Arabia; and the markets of II-Oleid and Bara, the chief towns, were stored with the produce of Arabia, India, and Abyssinia. This period of prosperity, however, was brought to a close by the invasion of K. in 1821, by an Egyptian army. Since then K. has remained a province of the Turkish empire, under the viceroy of Egypt.

KÖRNER, THEODOR, a patriotic German poet, was born at Gensingen, 23d September 1791, and after the publication of a collection of immature verses in 1810, betook himself to the university of Leipsic. Here the young author, who had no aptitude for serious and solid study, was led into several irregularities, which necessitated his leaving the university. After a short residence in Berlin, he went to Vienna, and began to write for the stage. His Der Grüne Domino (The Green Domino), Die Braut (The Bride), and Der Nachtwatcher (The Night-watchman), are among the best German comedies. His two most important dramas, Zriny and Rosamunde, though destitute of that sagacity of thought and knowledge of mankind which are essential to the permanent success of such works, are full of noble enthusiasm. The uprising of the German nation against the despotism of Napoleon, inspired K. with patriotic ardour. He joined the army of liberation, and displayed heroic courage in many encounters. The songs which he now wrote several of them in the camp—and published under the title of Leier und Schwert (Lyre and Sword), stirred his countrymen mightily. Their chief power, however, probably lies in their impassioned nationalty; foreigners at least fail to recognise in them much more, yet the Germans regard them with a kind of sacred admiration that forbids criticism. The most famous of these pieces is his Schwert-Lied (Sword-Song). K. was killed in battle near Rosenberg, 26th August 1813. A collected edition of his works (Staatsliche Werke, 1 vol. Berlin 1834; 4 vols. 1842, 4th ed. 1853) was published by Steffluss. A biography of the poet, written by his father, has been translated into English, with selections from his poems, tales, and dramas, by G. F. Richardson (Lond. 2 vols. 1845).

KOROS, NAGY, or GREAT KOROS, an important market-town of Hungary, in the county of Pesth, is situated in a sandy district, 49 miles south-east of the city of Pesth. Black sugar is here extensively reared, and an excellent red wine is grown. Pop. 16,100. Kiss Koros, or Little Koric, is a small town, situated 38 miles south-west of the foregoing, and also engaged in the production of wine. Pop. 8900.

KOSCIUSKO, TADEUSZ, a great Polish general and patriot, born about the middle of last century, in the province of Minsk, Western Russia, was descended from an ancient and noble, but not wealthy Lithuanian family. He became a captain in the Polish army, went to America, and served in the War of Independence. He returned to Poland in 1756, with the rank of general of brigade. In the campaign of 1792, he held a position at Dubienka for five days with 4000 men against 16,000 Russians, although he had had only twenty-four hours to fortify it, and finally withdrew his troops without much loss. This brilliant feat of arms laid the foundation of his military reputa-

tion. When King Stanislaus submitted to the will of the Empress Catharine, K. resigned his command, and retired to Leipsic; but returned in 1794, and put himself at the head of the national movement in Cracow, and afterwards in Warsaw. With 20,000 regular troops, and 40,000 armed peasants, he resisted for months the united Russian and Prussian army of 150,000 men. He was proof also against the most tempting proposals on the
part of the Prussian king. He was at last overpowered by superior numbers in the battle of Maciejowice, 16th October 1794, and fell from his horse, covered with wounds, and uttering the words 'Pol Pot.' He was kept a prisoner till after the accession of the Emperor Paul, who restored him to liberty, gave him an estate with 1500 peasants, and handed to him his sword, which K. declined to receive, saying: 'I have too much blood in my veins, as I have no longer a country.' He afterwards resigned the estate, and sent back from London the money which he had received from the emperor.

He spent the remainder of his life chiefly in France, and his chief enjoyment was in agricultural pursuits. When Napoleon, in 1806, formed a plan for the restoration of Poland, K. felt himself restrained from taking an active part in it by his position as an Ex-Protestant college of Sarospatak, to the Poles, published in his name in the Moniteur, was a fabrication. In 1814, he wrote to the Emperor Alexander,entreating him to grant an amnesty to the Poles in foreign countries, and to make himself constitutional king of Poland. He released from servitude, in 1817, the peasants on his own estate in Poland. His death took place on 13th October 1817, in consequence of his horse falling over a precipice. His remains were removed to Cracow by the Emperor Alexander, and were laid side by side with those of John Sobieski. See Falkensteins's K. nach seinen hömischen und öffentlichen Leben (2d edit. Leip. 1834).

KOŚLINS, a manufacturing town of Prussia, in the province of Pomerania, on the Mühlenbach, 7 miles from the Baltic Sea, and 85 miles north-east from Stettin. There are iron-foundries, and manufactories of tobacco, paper, &c. Pop. 10,939.

KOSSUTH, Lajos (Louis), the leader of the Hungarian revolution, was born in 1802 at Monok, in the county of Zemplin, in Hungary. His family is of noble rank, but his parents were poor. He studied law at the Protestant college of Sarospatak, and practised first in his native county, and afterwards in Pesth. In 1832, he commenced his political career at the diet of Pressburg as editor of a liberal paper, which, owing to the state of the law, was not published, but translated, and circulated.
The subsequent publication of a libellous paper led, in May 1837, to K.'s imprisonment. He was liberated in 1840, and became again the editor of a paper, in which he advocated views too extreme for the moderate liberal party amongst the nobles, but which took strong hold of the people in general, especially of the youth of the country. In November 1847, he was sent by the county of Pesth as deputy to the diet, and soon distinguished himself as a speaker, and became the leader of the opposition. He advocated the emancipation of the peasants, the elevation of the citizen class, the freedom of the press, &c., and after the French revolution of 1848, openly demanded an independent government for Hungary, and constitutional government in the Austrian hereditary territories. To his speeches must in great part be ascribed not only the Hungarian revolution, but the insurrection in Vienna in March 1848. On the dissolution of the ministry in September 1848, he found himself at the head of the Committee of National Defence, and now proceeded with extraordinary energy the measures necessary for carrying on the war. To put an end to all the hopes and schemes of the moderate party, he induced the National Assembly at Debreczin, in April 1849, to declare the independence of Hungary, and that the Hapsburg dynasty had forfeited the throne. He was now appointed provisional governor of Hungary; but being disappointed in his hopes for the intervention of the Western Powers, and finding the national cause jeopardised by the arrival of Russia on the scene of action, he endeavoured to arrange with her more decisive terms. The attempt was vain. Finding that the dissensions between himself and Gorgei (q. v.) were damaging the national cause, he resigned his dictatorship in favour of the latter. After the defeat at Temesvar on 9th August 1849, he compelled himself to abandon his position, and to flee into Turkey, where, however, he was made a prisoner; but though his extradition was demanded both by Austria and Russia, the Porte, true to the principle of hospitality, resisted all their demands. In September 1851 he was liberated, and the government of France refusing him a passage through their territory, he sailed in an American frigate to England, where he was received with every demonstration of public respect and sympathy. In December of the same year he landed in the United States, where he met with a most enthusiastic reception. He returned in June 1852 to England, and there he chief resisted, until the Italian war broke out against Austria, when almost the whole of the Hungarian emigrants left for Italy with Kossuth. He now (1863) resides in Turin.

KOSTROMA, capital of the government of that name, in European Russia, is situated near the junction of the Kostroma and Olga rivers, 141 miles from St Petersburg. It was founded in the middle of the 12th c., and suffered much from the invasions, first of the Tartars, afterwards of the Poles. K. has considerable manufactures, chiefly of linen, and manufactures in corn, tallow, timber, hessian, and leather. Pop. 20,630.

KOSTROMA, a government of Great Russia, is bounded on the W. by the government of Jaroslar, and on the E. by the district of Kazan. Area, 39,834 square miles; pop. (1859) 1,073,988. The surface is generally flat, marshy, interspersed with lakes, and, especially in the north and east, with extensive and dense forests. The greater part of the soil is uncultivated. The chief rivers are the Volga, with its tributaries the Kostroma, the Uza, and the Ufia. The climate is severe, agriculture is the principal occupation of the inhabitants, and grain is produced in sufficient quantity for local consumption. Flax and hemp are extensively cultivated; wheat, pitch, tar, and potash are largely manufactured and exported; and there is a flourishing trade in timber.

KOTAH, the chief town of a protected state of the same name, is situated in Rajportana, in lat. 25° 10' N., and long. 75° 52' E. It is on the right bank of the Chambul, and is fortified with a rampart and a ditch. The town is tolerably wealthy, being, moreover, of considerable size, and of some architectural pretensions. In 1857, notwithstanding the defeat of the rajah by the British government, K. fell under the power of the mutineers, remaining in their possession until 30th March 1858, when it was stormed by General Roberts. The principality contains 4,400 square miles, with an estimated population of 60,000.

KOTZEBUE, August Friedrich Ferdinand von, a most prolific German dramatist, was born at Weimar on 31st May 1761, and after a checkered life, spent first in Russia, and afterwards in Austria and Germany, was assassinated at Mannheim, 25th March 1819, on account of his hostility to the liberal movement. Among his dramatic performances (the chief merit of which consists in their superior knowledge of stage-effect), may be mentioned: Die Indianer in England (The Indians in England), Meschkenhau und Ruse (Misanthropia and Repulsed).
KOUBA—KREFELD.

—the latter, under the title of The Stranger, being well known on the English stage—Die beiden Klingsberg (The Two Klingsbergs), Die Späther in Peru, &c. K. wrote no fewer than ninety-eight dramas, which have been collected in editions of 28 (Leips. 1797—1825) and of 44 vols. (1827—1829). Several of them have been translated into English.

KOUBA, a town in the south of Russia, on the eastern slope of the Caucasus, in the government of Derbend, 55 miles south-south-east of the town of that name, lat. 41° 22' N., long. 45° 31' E. Agriculture, fishing, the rearing of silkworms, and trade with Astrakhan and Persia, chiefly employ the inhabitants. Pop. 9405. It was annexed to Russia in 1806.

KOUBAN, a river in the south of Russia, rises on the declivity of Mount Elburz, and flows first north, then west, separating the governments of stavropol and the Cossacks of the Black Sea from Circassia. It is about 400 miles in length, exclusive of its windings, and it falls partly into the Black Sea, partly into the Sea of Azof.

KOUESSAO, a town in Egypt, on the northern border of the government of Saratov, 110 miles north-north-east of the town of that name. Pop. 13,107, who are employed chiefly in bee-keeping and in woollen manufactures.

KOYNO, capital of the government of the same name, in European Russia, near the confluence of the Vilia and the Niemen, was founded in the 10th c., and was the scene of many bloody conflicts between the Teutonic Knights and the Poles during the 13th and 14th centuries. Its circumference, notwithstanding its advantages of situation—being not only near the confluence of two navigable rivers, but also on the great railway from St Petersburg to Berlin—is very insignificant. Pop. 24,632.

KOYNO, a government of West Russia, lies immediately south of the province of Courland, and is bounded on the south-west by Prussia and Poland. Area, 16,115 square miles, not more than one-third of which is cultivated, and about one-third under wood. Flax and hemp are important products. Pop. (1858) 986,287. The surface is flat and marshy, and there are numerous lakes. The chief rivers are the Niemen, with its tributaries the Vilia, Neveja, and Donbassa. Pica Polonica (q. v.) is commonly reared. After the year 1843, this government formed a part of that of Wilna.

KOZELIJSK, a district town of Great Russia, in the government of Kalouga, and 40 miles south-west of the town of that name, stands on the right bank of the river Jisdr. Pop. 7429. It carries on a great trade in hemp, and an extensive manufacture of sailcloth. K. is famous in history for the brave but unsuccessful resistance made here to Batu Khan of Kipchak.

KOZLOF, a town of Russia, in the government of Tambov, is advantageously situated on the Voronet, in lat. 52° 53' N., long. 40° 31' E. It was founded by the Czar Michael Fedorovitch as a stronghold against the Tartars. It is a flourishing town, has numerous woollen, linen, and other factories, and a pop. of 23,000, who are employed largely in agriculture, and in horse and sheep breeding.

KRAJOVA, a town of Wallachia, in Little Wallachia, near the eastern bank of the Schyl, 120 miles west of Bucharest. It is the residence of many rich bojars (nobles), carries on considerable commerce, and is a centre of manufactures.

KRÄKEN, a fabulous animal, first described by Pontoppidan in his Natural History of Norway, and from time to time said to have been seen in the Norwegian seas. Enormous magnitude is ascribed to it; it is said to rise from the sea like a land animal, to stretch out its hinder parts, and then, as it sinks again into the deep, to cause a whirlpool, in which large vessels are involved to their destruction. The tale of the K. has considerable analogy to the more recent stories of the Great Sea Serpent (q. v.). It is not, however, to be summarily rejected as mere unmingled fable. There may, perhaps, be some foundation for its occurrence in the feature of the cephalopods, to the general characters of which the description given of it naturally agrees, great exaggeration as to size being of course allowed for. Large as some of the cephalopods known to exist in some of this kind do exist much larger than any that have been accurately described; and stories, similar to the Norwegian ones recorded by Pontoppidan and others, are current in different parts of the world. Such is the story told by Playn concerning a vast animal with prodigious arms which impeded the navigation of the Strait of Gibraltar. See Chamber's Edinburgh Journal, first series, XX. 226.

KRAMERIA. See RATTANY ROOT.

KRASNOIARSK, chief town of the Siberian government of Yenisseisk, is situated on the great road from European to Eastern Siberia, a town distant of 3197 miles from St Petersburg. It contains 7628 inhabitants, chiefly Cossacks, some of whom possess numerous herds of cattle and horses. There is a considerable trade in furs, and there are about thirty tan-yards and other factories.

KRAZINSKI, COUNT VALERIAN, a scion of an illustrious Polish family that had early adopted the Protestant religion, was born about 1780. Being possessed of great natural abilities, which were improved and matured by a thorough education, he was appointed one of the chief officials in the bureau of Public Instruction for Poland. He strenuously exerted himself to promote education through the various classes of dissenters, and, with a view to this, introduced, at great expense to himself, the process of stereotyping. When the Poles rebelled in 1830, and set up an independent government, K. was sent as their representative to London, where, from 1831, he remained as an exile. He was in London for twenty years, until 1853. In 1843, this government formed a part of that of Wilna.

KREASOTE. See CREASOTE.

KREATINE. See CREATINE.

KREFELD, an important manufacturing town of Rheinish Prussia, twelve miles north-west of Dusseldorf. It owes its importance to the settlement here, in the 17th and 18th centuries, of numerous refugees, who were driven from the neighboring countries by religious persecution, and who established here the silk and velvet manufactures for which K. is now the most noted town in Prussia. The town itself, and the surrounding district, is upwards of 20,000 hands in these manufactures, and the value of the goods produced annually is estimated at upwards of a million sterling. K. also carries on manufactures of woollen cloth and 321
KREMENCHUG, a district town of Little Russia, in the government of Poltava, on the left bank of the Dnieper, ninety miles above Ekaterinoslav. It was founded in the 16th c. by Segmasimus-Augustus, king of Poland, as a barrier against the Tartara. During the reign of Catherine II., it was the chief town of New Russia, and it is now the seat of great industrial and commercial enterprise, containing 34 factories, chiefly for melting tallow and for rope-making. Pop. 19,517.

KREMITZ, a district town of West Russia, in the government of Volyn (Volhynia), is situated 130 miles west of Jitomir, and about 20 miles from the frontier of Austrian Galicia. It has 10,486 inhabitants, and seven annual fairs are held here, but, owing to the want of river-communication, the commerce is limited.

KREMNI'TZ, a town of Hungary, in the county of Bars, in a deep gloomy valley, twelve miles west-south-west of Neusohl. It is famous for its gold and silver mines, which, however, are not so productive now than formerly. Pop. 5400, who are almost entirely of German origin.

KREMS, a town of Lower Austria, in a picturesque district on the Danube, at the confluence of the Krems with that river, 38 miles west-north-west of Vienna. It manufactures mustard and powder, and trades in wine. Pop. 5300.

KREUZER—from the cross (kreuz) formerly conspicuous upon it—a small copper coin current in Southern Germany, the 60th part of the golden or Florin (q.v.).

KREUZNAOCH, a town in the province of Rhenish Prussia, on the Nahe, a few miles from its junction with the Rhine, and 38 miles south-south-east of Coblenz. It has crooked narrow streets, old-fashioned houses, and about 10,000 inhabitants. It dates its existence from about the 9th century. It is chiefly notable, however, for its salt springs, which were discovered in 1478, and which, containing iodine and bromine, are serviceable in many diseases. It is therefore much frequented. The springs are of various temperatures, from 45° to 84° F.

KRMIMTSCHAU, a town of Saxony, about 23 miles from Leipzig, on the railway between that place and Hof. It is a busy manufacturing town, the industrial products being woollen yard, woollen and cotton fabrics, buttons, needles, &c. Pop. 9576.

KRISHNA, the eighth Avatara or incarnation of the Hindu god Vishnu. See Vishnu.

KROTOVEZ, a town of Little Russia, in the government of Tcheremnov, is situated 100 miles east of the town of that name. A famous annual market is held here. Pop. upwards of 6000.

KROSSEN, a walled town of Prussia, on the left bank of the Oder, 32 miles south-east of Frankfort. There are manufactures of wooden, linen, leather, and earthenware. Pop. 7000.

KRUDNER, JULIANA VON, a religious visionary and enthusiast, daughter of Baron von Viettinghoff, was born at Riga in 1766. When she was but 14, she married the Baron von Krüdner, a Livonian nobleman, who held the post of Russian ambassador at Berlin. After a married life of five years, she was unhappy, and after the birth of a son and daughter, she was divorced from her husband. The succeeding incidents of her stormy career are supposed to form the groundwork of the novel of Valerie, which she published in 1803. After many adventures, M. von K. came to Berlin, where she was admitted to the close intimacy of the queen, Louisa, of all whose projects M. von K. was the confidante and sharer. The shock occasioned by the death of this princess is said to have disturbed the balance of M. von K.'s mind; and from that date she became a zealous disciple of the celebrated Pietist, Jung Stelling, and ultimately gave herself up to religious mysticism in its most exaggerated form. From Berlin she moved to Paris, where she appeared as a prophetess, and the herald of a new religious era; and she attracted such notice by the fulfillment of certain of her predictions of public events, as of the fall of Napoleon, his return from Elba, and the final crisis of Waterloo, as to obtain access to the Emperor Alexander, and eventually to acquire much influence over him. Her gigantic schemes for the elevation of the social and moral condition of the world, caused her to appear a dangerous character in the eyes of persons in authority, and she was obliged to withdraw from France and other countries in succession. In consequence, she retired to one of her paternal estates near Riga, where she entered into relations with the Herrnhut sect; but her restless disposition soon carried her into fresh enterprises, the latest of which was the formation of a great correctional establishment in the Crimea for the reformation of criminals and persons of evil life. In the same year she died; and there her restless disposition carried her as far as Kara-su-bazar, December 13, 1824. Besides the novel already named, her only other work was a pamphlet entitled Le Camp des Vertus (Paris, 1815); but many curious details of her conversation and opinions are preserved in Krüger's Conversations with Madame von Krüdner, published at Leipzig in 1818.

KRUMAU, a small town of Bohemia, on the Moldau, 14 miles south-south-west of Budweis. Its castle, a fine structure placed on a rock, contains five secret courts, and is surmounted by numerous towers and pinnacles. There is some manufacturing industry. Pop. 6600.

KRUMMacher, Friedrich Wilhelm, the son of F. A. Krummacher, a clergyman who has distinguished himself by his zeal for old Lutheranism, and who was an opponent of the Rationalists. Some of his works, particularly his discourses on the history of Elijah the Tishbite, have not only acquired a great popularity in Germany, but, by means of translations, in Britain and America. Along with this man, who was called the Discourse of Elijah, in 1843, he was called as preacher to a German Reformed congregation in New York, but returned to Bremen in 1847, and now holds the office of chaplain of the Prussian court at Potsdam. K. is regarded as one of the most eloquent preachers in Germany.

KRUMMHORN (Ital. cornorso) is the name of a very old wind-instrument made of wood, the under part of which is bent outwards in a circular arc.—Krummhorn is also the name of an organ-stop, found in almost all German organs, and generally of eight feet pitch. The pipes are made of tin, the body or sounding part being cylindrical, and partly shut at the upper end. The Italian name of cornorso has been corrupted into English organ-builders into cromorno, which is the same word as English organa. The sound of the krummhorn as an organ-stop is soft and quiet; but it is defective in not keeping in tune as well as other reed-stops.

KSHATRIYA, the second or military caste in the social system of the Brahmanical Hindus. See Caste.

KUBLAI KHAN (called by the Chinese Ch'i-tsoo), more properly KUBULAI KHAN, the Kagan,
or Grand Khan of the Mongols, and Emperor of China, was the grandson of Genghis Khan through his fourth son, Tuly Khan. Being ordered by his brother Meng, then Kagan of the Mongols, to subjugate the Corean and China, K., availing himself of an application made by Si-Tsong of the Song dynasty to aid him in expelling the Manchus, entered China (1260) with an immense army, drove out these Tartars (or 'Khan dynasty), and took possession of the country. K. was a man of able and energetic prince, adopted the Chinese mode of civilization, and endeavored himself to his subjects by his attention to men of letters, and the honours which he bestowed on the memory of their former renowned monarchs. In 1279, he completed the ruin of the Song dynasty by invading and subduing Southern China, and founding a new dynasty—that of the Yuen (the first foreign race of kings that ever ruled in China). From 1259, K. had been the Kagan of the Mongols, so that his dominions now extended from the Frozen Ocean to the Strait of Malaccas, and from the Corea to Asia Minor—an extent of territory the like of which had never before, and has never since, been given by anyone one monarch. He was also the last grand khan whose name, however, of suzerainty was recognized over all the countries conquered by the Mongol arms. His court was attended by the learned men of India, Persia, Transoxiana, and Asia Minor, and Europe, among them was found the celebrated Marco Polo. Towards the close of his life, he sent an expedition against Japan, but it failed. Irritated by this disaster, he indemnified himself by the conquest of Mantchuria and other neighboring districts; but he was murdered by the Tartars at Peking in 1294. The grand dukes of Russia were among his tributaries.

KUILEN—KUH-HORN.

KUIFIC COINS is the name of the earliest Mohammedan coins, inscribed with the Kufic or ancient Arabic character (see the following article). According to Makrizi, the first were struck in the 9th year of the Hijrah (638 A. D.), under Caliph Omar, who, wishing to make Islam entirely independent of foreign, chiefly Byzantine and Persian, influence, even in the province of money, caused 'Mohammad' coins to be struck. In the shape of those Persian and Byzantine coins which had been circulating among his subjects till then, and he caused them to be inscribed with Koranic passages. According to other Arabic writers, however, (Al-Makzin, Soylun, Ibn Ketibha, &c.), the earliest Kufic money dates from the time of Calif Abd Al-Malek (76 H. = 693 A. D.), a period much more probable, considering that no Kufic coins have hitherto been discovered anterior to 77 H. They were first of gold, the former being dinar (corrupted from denarius—a name, moreover, wrongly applied), of the value of about 10s. 8d.: the latter, dirham (dirhama), worth about 5s. Not before 116 H. were copper coins, fals (folia: obolus:), introduced, and the material for them was taken by the order of Calif Walid from a colossal bronze statue of an idol. Figures, human or otherwise, are rarely met with on these coins. The legend generally runs either around the margin, or enclosed by a ring. The oldest dinar—of 77 H.—is preserved in the Milan Museum (formerly Cav. Millingen's collection). Next comes the Stockholm Academy, with a dinar of 79 H. The oldest dirhem found as yet, dated 92 H., is likewise in Milan, in the Museo di Stefano di Mainoni. One of the richest collections of Kufic coins is in the Stockholm Academy: owing chiefly to the great numbers found on the shores of the Baltic, brought thither probably by Mohammedan traders in the middle ages. Not before the 7th c. H. were the Kufic characters superseded by the modern Neshki, upon coins; while for books, &c., they had long fallen into disuse. The best authorities on this subject are Makrizi, Adler, the Tychsen's, Reiske, De Sacy, Castillon, Canau, Fränz, Lindberg, Pietraszewski.

KUFIC WRITING, an ancient form of Arabic characters, which came into use shortly before Mohammed, and was chiefly current among the inhabitants of Northern Arabia, while those of the south-western parts employed the Himyarite or Monad (clipped) character. The Kufic is taken from the old Syric character ( Estrangelo), and is said to have been first introduged by Moramar or for the Neshki, slit reeds are employed. Different kinds of the latter character (in which the alphabet is arranged according to the outward similarity of the letters) are the Moreseque or Maghreb (Western), the Divani (Royal)—only employed for decrees, &c., the Thalik (chiefly used in the Thaouleti, threefold or very large character), Jakuthi, Rihani, &c.

KUGLER, FRANZ THEODOR, a German historian of art, was born at Stettin, January 19, 1808, and studied at the university of Berlin. After the completion of his studies in different parts of Europe, he devoted himself to the study of the finer arts. In 1833, he became a professor in Berlin, where he died, March 16, 1858. His most valuable works are a Handbuch der Geschichte der Malerei, &c. (Manual of the History of Painting from the Time of Constantine the Great to the Present Day, 1837), which has been translated into English—the part relating to Italian art by Sir Charles and Lady Eastlake, and that relating to English art by Sir Edmund Head; and a Handbuch der Kunstgeschichte (Manual of the History of Art, &c., 1842). He is also favourably known as a poet and as the author of several dramas.

KUH-HORN, sometimes called ALPHORN, is a wind-instrument much used by the herdsmen in the mountainous countries of Germany. It consists of a tube about three feet long, and a little bent, and gradually widening out into a kind of bell, like a horn of a musimon. It is made of a fragment of horn or the bark of an ash, willow, wrought together, and bound by a pitchted cord. The sound of the kuh-horn is produced by a mouth-piece like that of a trombone. It has generally only five notes, but extending over nearly
two octaves—viz., C, C, E, G. With these five
notes, the herdmans often play most interesting
melodies, which, among the mountains, have an
indescribable charm. The following is a specimen:

KULM. See Liqueur.

KUMQUAT (Citrus japonica), a small species of
orange, a native of China and Japan, and much
cultivated in those countries. It has been intro-
duced into Australia. It endures more frost than
any other of the genus, and will probably prove a
valuable acquisition to many parts of Europe and
America. The plant is a shrub sometimes six feet
high, but in cultivation it is not allowed to exceed
the height of a gooseberry-bush. The fruit is oval,
and about the size of a large gooseberry; the rind
is sweet, and the juice acid. It is very delicious and
refreshing. The Chinese make an excellent sweet-
meat by preserving it in sugar.

KU'NERSDORF, a village of Brandenburg, in
Prussia, nearly ten miles north-east of Frankfurt-
on-the-Oder, was the scene of one of the most
remarkable battles of the Seven Years' War, fought
on the 12th August 1759, in which Frederick the
Great was completely defeated by a combined attack
of Russia, Sweden, Silesia, Silesia, and Austrians under
Lamoral. The loss on the Prussian side was 22,000
men, with almost all their artillery and baggage,
while their opponents lost 24,000 men.

KUNGUR, a town in the south of the govern-
ment of Perm, European Russia, and 1416 miles
from St. Petersburg, renowned for its tanneries, in
which the best quality of Russian leather is pro-
duced. In the neighbouring district are several
large ironworks. Pop. (1839) 8298.

KUNIGU'NDE, St, wife of the Emperor Henry
I1, was the daughter of Count Siegfried of Luxen-
burg. Her husband, Duke Henry of Bavaria, was
crowned king of the Germans in 1002, and emperor
in 1014. Her reputation having been unjustly
assailed, she vindicated herself by walking bare-
footed over hot ploughshares. After the death of
her husband in 1024, she retired into the convent of
Kaufungen, near Cassel, which she had founded,
spent the remainder of her days in pious works,
and died on 3d March 1040. Pope Innocent VII
gave her a place amongst the saints in 1200.

KUPPERSCHIEFER, one of the series of
strata which make up the Permian rocks. It
consists of beds of dark shale with copper ore (hence the name), and containing beautifully preserved fish, of species nearly allied to those of the Coal Measures.

KUR, or KUR (anc. Cyrus), the principal river of the Caucasus, rises in the Sahandu chain, and after a south-eastern course of 535 miles, falls into the Caspian Sea by several shallow channels, about 60 miles north of the Persian boundary. Its chief valleys are the Araba (anc. Araxes), the Alazan, and the Yora. The K. has so rapid a course, and changes its channel so frequently, that to bridge it is almost impossible.

KURDISTAN ("the Country of the Kurds"), an extensive region of Western Asia, ranging north, west and south-east, between lat. 34°-49° N. and long. 56°-48° E., bounded on the N.E. side by Armenia, Azerbaijan, and Irak-Ajemi, and on the S.W. by the Tigris and Aljezira, belongs to the Turkish and Persian monarchies, and is formed, and contains about 100,000 square miles, with a population amounting, according to chemist's estimate, to 3,000,000—doubtless a very great exaggeration, though we have no means of disposing of the country, with the exception of the tract bordering on the Tigris, is a very mountainous, some of the peaks being nearly 13,000 feet above the sea-level; these mountain-ranges divide the surface of the country into fertile valleys and extensive table-lands. The south-west coast is for the most part low and flat, parched in summer, and verdant during the wet season. The country is traversed by the Phrygates, Tigris, Zab-Ala, Zah-Asfal, and D'yula or Shirvan, and contains several lakes, the chief of which are Kinner, Kutch and Urumiah. Four-fifths of the inhabitants are Kurds (anc. Cardushi and Gordynai), a race partly nomad and partly agricultural, who occupy themselves chiefly, however, with the breeding of sheep, goats, and horses. A great trade is carried on with Turkey and Persia, especially in horses, the Kurdish breed being so famed for its spirit and endurance, as to be almost exclusively employed by the Turkish and Persian cavalry. The settled portion of the population consists of Kurds, Turks, and Persians who are engaged in agricultural employments. A remarkable product of this country is a substance found on the leaves of the sarmasik and other shrubs, which corresponds in the neighbourhood of "manna" given in the Old Testament, and is supposed to result, like oak-galls, from the puncture of the leaf by an insect. The country is deficient in mineral wealth. The inhabitants, with the exception of the Northrians (q.v.), who inhabit the valley of the Tigris, profess a deformed form of Mohammedanism.

The chief town in Turkish K. are Bitlis (q.v.), Van, Urumia, Mardin (anc. Nardeia), Moush, Korkuk, Durbekir, Malatia, and Marash. The Persian portion of K. does not form a distinct province, but is included in Azerbaijan, Ardelan, and Irak-Ajemi.

KURILE ISLANDS, a line of islands in the North Pacific Ocean, extend between the south extremity of Kamchatka and the Japanese island of Tesching. They are under the government of the Russo-American Company, and are 22 in number, 19 of them belonging to Russia. Area of the islands possessed by Russia, 3843 square miles; pop. between 200 and 300. Since 1781, no tribute has been collected here. The K. I. are all volcanoes. The vegetation is poor; the principal productions being the furs of foxes, wolves, seals, and beavers. Navigation near the islands is difficult.

KURISCHES HAFF, an extensive lagoon, separated from the Baltic Sea by a ridge of sand from one to two miles in width. It extends nearly sixty miles along the coast of East Prussia from Labiau to Memel, where it enters the Baltic by the "Memel Deeps," a channel about 1500 feet deep, and 12 feet deep. Its greatest breadth at the southern extremity is about 28 miles, but its average breadth is not above 14 miles. The waters of the K. H. are fresh. Its depth is very variable, and hence its navigation, which is accomplished by small boats, is both difficult and dangerous. The belt of land is called the "Kurische Neurung," and has a few villages upon it.

KURNUL, the chief town of a district of the same name, in the presidency of Malars, in lat. 45° N., and long. 78° 12' E. Pop. estimated at 20,000. The district itself—separated on the north by the Krisha from the Nizam's dominions—contains about 2700 square miles, and about 2,00,000 inhabitants. The country possesses considerable works for the purposes of irrigation. KURRACHI, the only port in Sind for seagoing ships, lies about twelve miles north-west of the most westerly mouth of the Indus, in lat. 24° 51' N., and long. 67° 2' E. It was taken by the British in 1839, and has since advanced with rapid strides in the path of improvement, the population having in three years (1839 to 1842) increased from 12,000 to more than 22,000. As the mouth of the Indus is barred by sand-banks, K. is virtually the terminus for the traffic on that river. It is connected by the Sind Railway with Hyderabad, thence, by means of the Indus Steam Fishing Company's vessels, with Sakar and Multan, and from the latter place by the Punjab Railway, with Lahore, Amritsar, Feshawur, &c. Since January 1860, it has had direct communication, by submarine telegraph, with Muscat and Alexandria. The exports of K. are camels, fish, hides, tallow, ghee, oil, bark, salt, indigo, cotton, and grain; and the imports, metals, hardware, silk, cotton, and woollen goods. K. has an active inland trade with Cashmere, Turkestan, Afghanistan, and Tibet. It contains an English church and school.

KURSK, one of the governments in the south of Great Russia, lying south of Orel, contains 17,573 square miles, the most of which is arable. The province is watered by feeders of the Don, and the Don itself. The soil being very fertile, large crops of corn are raised, and even in scantly years, K. can supply the neighbouring provinces. The pop. in 1858 was 1,511,972, of whom the greater part are employed in agriculture. The people are industrious, and also devote themselves to cattle-breeding and orchard-gardening. The principal manufactures are spirits, leather, soap, and saltpetre, and the products are largely exported. Hemp and horses also form important items in the export trade of the province.

KURSK, the chief town of the government of that name, on the right bank of the Seim, a branch of the Desna, dates from the 9th century. It suffered considerably from the ravages of the Tartars and Polas, but is still a flourishing town, numbering 27,056 inhabitants, and carrying on a considerable trade in tallow-melting, rope-making, and tanning. K. is also celebrated for its orchards, the fruit of which is in great request. Near the town, a fair is held in July, when more than £1,000,000 worth of commodities are disposed of, the chief being manufactured silk and woollen fabrics, sugar, tea, horses, &c.

KURU, a name of great celebrity in the ancient or legendary history of India. See MAHABHARATA.

KÜSTENLAND (i. e., Coast District, Ital. Litorale), a crown-land of Austria, consisting of the county of Görz and Gradiska, markgrafom o
KÜSTRIN—KYTHUL.

Isria, and the town of Trieste with its territory. It lies between the crown-land of Carniola on the north-east and the Gulf of Venice on the south-west. Area, 3048 square miles; pop. 389,900. Together with the crown-lands of Carniola and Carniola, it constituted in former times the kingdom of Illyria. The surface is mountainous. The chief rivers are the Isonzo and the Quieto. The soil in general is fruitful; figs ripen without almost any cultivation, and vineyards extensively made. In the mountainous districts in the north and north-east the breeding of cattle is the chief branch of industry. Commerce is extensively carried on at various seaports.

KÜSTRIN, a town of Prussia, and a fortress of the third rank, is situated in the midst of extensive morasses, at the confluence of the Warthe with the Oder, twenty miles north of Frankfurt. Pop. 9292.

KUTAIFEH, KUTAHIA, or KUTAYA (the ancient Cotium), an important town of Asiatic Turkey, in Anatolia, capital of the eyalet in which it is situated, stands seventy miles south-east of Brusa, on the Parsuk, a tributary of the Sakarya—the ancient Sangarius. It is said to have a good trade, and a population of about 30,000.

KUTAI'S. See TRANSCAUCASIA.

KUTTENBERG, a mining town of Bohemia, about forty miles east-south-east of Prague. Here, in 1237, silver was found, and the silver-mines were first worked. The first silver groshen were struck here in 1300. The silver-mines have not been worked for about 300 years, the chief mineral products of the district being now copper and lead. Cotton-spinning, cotton-printing, and bleaching, are also carried on. Pop. 10,500.

KUTUSOW, MICHAEL LAURIONOWITSH Golenitschef, Prince of Smolenskoi, a Russian field-marshall, born in 1745, early entered the Russian army, and in 1787 was appointed governor-general of the Crimea. He distinguished himself in the Turkish war, and after various other services, was appointed in 1805 to the command of the first corps d'armée against the French. On 18th and 19th November of that year, he was victorious over Marshal Mortier at Dürenstein. He was second in command of the allied army, of which the Emperor Alexander himself was commander-in-chief, at Austerlitz. In 1811—1812, he commanded the Russian army in the war against the Turks, and notwithstanding his advanced age, he succeeded Barclay de Tolly in 1812, as commander-in-chief of the army against the French, and obtained a great victory over Davout and Ney at Smolensk. He carried on

campaign to its successful termination; but his strength was exhausted, and he died at Bunsis, 28th April 1813.

KUVERA, the Hindu Plutos, or god of wealth. He owes his name—which literally means 'having a wretched (dvu) body (vema)—to the deformities with which he is invested by Hindu mythology. He is represented as having three heads, three legs, and eight teeth; his eyes are green, and in the place of one he has a yellow mark; he wears an earring but only in one ear; and though he is properly of a black colour, his belly is whitened by a leprous taint. He is seated in a car (pushpika) which is drawn by hogsheads. His residence, Abāl, is situated in the mines of Mount Kalskea, and he is attended by the Yakshas, Māyas, Kannaras, and other imps, anxiously guarding the entrance to his garden, Chaitrarastra, the abode of all riches. His treasures—apparently precious gems—are especially intrusted to his care. His wife is a hobsbina, Yakob, or Yakash, and their children are two sons and a daughter. As one of the divinities that preside over the region, he is considered also to be the protector of the north.

KYANISING, the most efficacious method of preserving ships from Dry Rot (q. v.), by injecting into the pores of the wood a solution of corrosive sublimate, was invented by John H. Kyan, who was born in Dublin, November 27, 1774, and died in 1835.

KYRE, a district of Ayrshire (q. v.).

KYRIE ELEISON (Gr. Kyrie eleison, Lord have mercy), a form of prayer which occurs in all the ancient Greek liturgies, and is retained in the Roman Catholic mass. It follows immediately after the Introit, and forms the introduction to the hymn of praise, 'Gloria in excelsis Deo' (Glory to God on high). The retention of the Greek language in this prayer, is one of many evidences of the predominance of the Greek element in the early Roman Church (Milman's Latin Christianity, l. 10). The same peculiarity occurs in a few others of the Roman services, especially those of the Holy Week.

KYTHUL, the chief town of the Indian district of the same name, about 1096 miles to the north-west of Calcutta, in lat. 27° 49' N., and long. 76° 28' E. It is substantially built of brick, having a lofty palace, which looks down from a beautiful grove on a spacious sheet of water. It was only in 1843 that the territory fell to the English East India Company, having lapsed through the failure of heirs. It then comprised more than 300 villages, with a revenue of £44,000.
THE twelfth letter of our alphabet, as was called Lamell, i.e., 'ox-goad,' by the Hebrews, doubtless from its resemblance to that implement—a resemblance still traceable in the Phoenician. L belongs to the order of consonants called Liquids, and has the closest affinity to R. In some languages, there is only one sign for both, as in Pehli; and in others, the one or the other sound is altogether wanting. Hence the numerous substitutions of the one sound for the other which occur in Aryan languages. Thus, Eng. plum, Ger. pflaume, from Lat. prunus; Eng. pilgrim, Lat. peregrinus; Gr. or Lat. epistola, Fr. épître; the Swiss peasants pronounce Kirche, Kicche; and the Lat. termination -atia becomes, after l, -atra—-as, materi-aria, famil-aria. L is also interchangeable with n—as, Gr. pneu'mon, Lat. pulmo; and, rather strangely, with D (g. v.). In certain combinations, the l of Latin words has become i in Italian—as, pianu, piano; Floreale, Firenze. In Eng. l is often mute, as in calm, yolk, should. In the Scottish dialect, it is mostly mute in the end of words—as, fa', fi', a', for fall, full, all. Similar to this is the frequent melting of l into w in modern French—thus, d le has become ou; cherche, chercheur.

LA. See SOLIMINATION.

LAA'LAND, or LOLLAND (i.e., low land), a Danish island in the Baltic, at the southern entrance to the Great Belt. Area, 432 square miles; population about 56,000. The surface is remarkably flat, and the soil exceedingly fruitful. Forests of beech and oak cover upwards of 50 square miles. The chief town is Nakskov, with a pop. of 3,375, a good harbour, and considerable trade. At Aalholm, near the Nysted Fiord, there is the largest, and in exotic plants the richest, private garden in the whole of Denmark.

L'A'BARUM (derivation uncertain), the famous standard of the Roman emperor Constantin, designed to commemorate the miraculous vision of the cross in the sky, which is said to have appeared to him on his way to attack Maxentius, and to have been the moving cause of his conversion to Christianity. It was a long pike or lance, with a short transverse bar of wood attached near its extremity, so as to form something like a cross. On the point of the lance was a golden crown sparkled with gems, and in its centre the mysterious monogram of the cross and the initial letters of the name of Christ, with the occasional addition of the Greek letters A and Ω. From the cross-beam depended a square purple banner, decorated with precious stones, and surrounded by a rich border of gold embroidery. The cross was substitut-d for the eagle, which had formerly been depicted on the Roman standards, and there were sometimes other emblems of the Saviour. In the space between the crown and the cross were heads of the emperor and his family, and sometimes a figure of Christ woven in gold.

LABEL. See DIAPER.

LABEL. (Fr. lambran, a strip or sherd), the ribbon pendant at the sides of a mitre or coronet.

LABEL, LAMBEL, or FILE, in Heraldry, the mark of cadency which distinguishes the eldest son in his father's lifetime, familiar to us from its entering into the composition of the arms of the Prince of Wales and other members of the royal family. It consists of a horizontal stripe or fillet, with three points depending from it (fig. 1). When the mark of cadency itself is designated a file, its points are called labels. It is doubtless that the eldest son's eldest son should wear a label of five points in his grandfather's lifetime, and, similarly, the great-grandson a label of seven points, two points being added for each generation. The label extended originally quite across the shield, and sometimes occupied the upper, though now it is always placed in the lower part of the chief: the points, at first rectangular, assumed in later times the form called pattée, dovetailed, or wedge-shaped; and more recently, the label ceased to be connected with the edges of the shield. Edward I, in his father's lifetime, bore the arms of England within a label not of five, but of five points azure, joined to the head of the shield, and interlaced with the tail of the uppermost lion (fig. 2); Edward II, when Prince of Wales, used indifferently the label of three or of five points, as also did Edward III; but from the time of the Black Prince downwards, the eldest son of the king of England has invariably differentiated his arms with a label of three points argent, and the practice has been for the younger sons also to bear labels, which are sometimes of other colours and more points, and differentiated by being charged with fleurs-de-lis, castles, torteaux, hearts, crosses, &c., as directed by the sovereign by sign-manual registered in the College of Arms. The practice of differentiating by the label which is thus sir vit on, obverse, is in our own and other royal families, is less used by subjects. Like other marks of cadency, labels are sometimes borne as permanent distinctions by a particular branch of a family.

LABIATE (Lamiaee of Lindley), a natural order of exogenous plants, containing almost 2500 known species, mostly native of temperate climates. They are herbaceous, or more rarely half-shrubby, and have 4-cornered stems and opposite branches; and opposite leaves, without stipules, abounding in receptacles of volatile oil. The flowers are often in cymes or heads, or in whorls; sometimes solitary. The calyx is inferior, with five or ten teeth, or
LABORATORY—LABOURERS.

2-lipped. The corolla is hypogynous, 2-lipped, the lower lip 3-lobed. The stamens are four, two long and two short, or by abortion only two, inserted into the corolla. The ovary is deeply 4-lobed, seated in a fleshy disk, each lobe containing a single ovule; there is a single style with a bifid stigma. The fruit consists of 1—4 achenes, enclosed within the persistent calyx.—A general characteristic of this order is an aromatic fragrance, which in many species is very agreeable, and makes them favourites in our gardens. Some are weeds with an unpleasant odour. Many are natives of Britain. Some are used in medicine, and others in cookery for flavouring. Mint, Marjoram, Rosemary, Lavender, Sage, Basil, Savory, Thyme, Horehound, Balm, Patchouli, Germander, and Dead Nettle, are examples of this order.

LABORATORY, ROYAL, an extensive military manufacturing department in Woolwich Arsenal. Although it has existed for many years, it was only in 1855 that the present very large establishment was organised. Here are foundries for the casting of shot, shell, grape, &c.; apparatus for the manufacture of percussion-caps, which are formed—hundreds at a time—out of the copper sheet; presses where rifle-bullets are squeezed into shape; fuses in all stages of manufacture; and a thousand other instances of combined ingenuity and power. Conscious among the mechanism may be mentioned the making of paper for cartridges, and subsequently the making and filling of the cartridges themselves. Government liberally grants permission (through the War Office) to inspect the factory. The cost of the Laboratory varies according to the accumulation of stores, from £503,936 in 1861—1862 to £195,743 in 1863—1864. There are laboratories—though on a comparatively small scale—at Portsmouth and Devonport.

LABOUR, in Political Economy, a term so dependent for its meaning on the circumstances in which it is used, that any scientific definition of it would lead to misunderstanding. The best service, in fact, towards rendering it intelligible, is to clear away some attempts that have been made to subject it to scientific analysis and definition. It has been separated into productive and unproductive, but no such division can be fixed. A turner who puts a piece of wood on his lathe and makes a top is of course a productive labourer. The same quality cannot be denied to the man who beams a web for the loom; but if he shares in the production of the cloth, so does the overseer who walks about and adjusts the industrial arrangements of the manufacture. Having included him, we cannot well say that the policeman, who keeps order in the district, and enables its manufactures to go on, should be excluded. Again, the man who contributes to make a book, of course appears as a productive labourer; but what the author contributes is not matter, but intellect; and it would be difficult to maintain that he ceases to be productive if he deliver such matter in an oration or a sermon. We can hardly count the distiller, who makes a glass of whisky, a productive labourer, and exclude the musician, who produces another and less dangerous excitement. It is equally impossible to draw the line between bodily and intellectual labour, since there is scarcely a work to which man can put his hand which does not require some amount of thought. A distinction between capital and labour has often been attempted to be established with very fallacious and dangerous results. Capital in active operation infers that its owner labours. If the capital is not laboured, the owner must be content to let it lie at ordinary interest. If he want profit from it, he must labour, and often severely. In a large manufacture, where the proprietor is supposed to be a gentleman at large, drawing his fortune from the sweat of the brow of his fellow-men, he is often the most anxious and the hardest-worked man in the whole establishment.

LABOURERS. The only peculiar laws affecting labourers are where they come within the description of 'servants in husbandry, artificers, calico-printers, handicraftsmen, miners, colliers, keelmen, pitmen, glassmen, potters, labourers, or other persons'—the word 'labourer' applying to a description of employment which, though comprehensive, is difficult to be defined. There must be a contract of service of some kind. The peculiarity consists in a summary remedy being provided for and against them before justices of the peace, who may compel them to serve out the time they contracted for, under a penalty of fine or imprisonment, and on the other hand, may order the masters to pay the wages. See SERVANTS. Labourers' wages are prohibited from being paid in kind or with goods, by the Truck Act (q. v.).
This book should be returned to the Library on or before the last date stamped below.
A fine of five cents a day is incurred by retaining it beyond the specified time.
Please return promptly.
